# Efficient and Consistent Bundle Adjustment on Lidar Point Clouds (Supplementary)

Zheng Liu, Xiyuan Liu and Fu Zhang

Please note that equation numbers and section numbers from the main manuscript are labelled in this letter in red.

#### I. LEMMAS

**Lemma 1.** For a scalar  $x \in \mathbb{R}$  and a matrix  $\mathbf{A} \in \mathbb{S}^{3 \times 3}$  which depends on x, we have the two following conclusions.

$$\frac{\partial \lambda_l(x)}{\partial x} = \mathbf{u}_l(x)^T \frac{\partial \mathbf{A}(x)}{\partial x} \mathbf{u}_l(x) \tag{1}$$

$$\frac{\partial \mathbf{u}_l(x)}{\partial x} = \sum_{k=1, k \neq l}^3 \frac{1}{\lambda_l - \lambda_k} \mathbf{u}_k(x) \mathbf{u}_k(x)^T \frac{\partial \mathbf{A}(x)}{\partial x} \mathbf{u}_l(x) \quad (2)$$

where  $\lambda_l$  (l=1,2,3) denotes the l-th largest eigenvalue and  $\mathbf{u}_l$  is the corresponding eigenvector.

*Proof.* Since the matrix A(x) is symmetric, its singular value decomposition is,

$$\mathbf{A}(x) = \mathbf{U}(x)\mathbf{\Lambda}(x)\mathbf{U}(x)^{T} \tag{3}$$

where  $\Lambda(x) = \text{diag}(\lambda_1(x), \lambda_2(x), \lambda_3(x))$  consists of all the eigenvalues and  $\mathbf{U}(x) = \begin{bmatrix} \mathbf{u}_1(x) & \mathbf{u}_2(x) & \mathbf{u}_3(x) \end{bmatrix}$  is an orthonormal matrix consisting of the eigenvectors. Therefore,

$$\mathbf{\Lambda}(x) = \mathbf{U}(x)^T \mathbf{A}(x) \mathbf{U}(x) \tag{4}$$

Both sides take the derivative of x,

$$\frac{\partial \mathbf{\Lambda}(x)}{\partial x} = \mathbf{U}(x)^T \frac{\partial \mathbf{A}(x)}{\partial x} \mathbf{U}(x) + \mathbf{U}(x)^T \mathbf{A}(x) \frac{\partial \mathbf{U}(x)}{\partial x} + \left(\frac{\partial \mathbf{U}(x)}{\partial x}\right)^T \mathbf{A}(x) \mathbf{U}(x) \tag{5}$$

Since  $\mathbf{U}(x)^T \mathbf{A}(x) = \mathbf{\Lambda}(x) \mathbf{U}(x)^T$  and  $\mathbf{A}(x) \mathbf{U}(x) =$  $\mathbf{U}(x)\mathbf{\Lambda}(x)$ , the equation is

$$\frac{\partial \mathbf{\Lambda}(x)}{\partial x} = \mathbf{U}(x)^T \frac{\partial \mathbf{A}(x)}{\partial x} \mathbf{U}(x) + \mathbf{\Lambda}(x) \underbrace{\mathbf{U}(x)^T \frac{\partial \mathbf{U}(x)}{\partial x}}_{\mathbf{D}(x)}$$

$$+\underbrace{\left(\frac{\partial \mathbf{U}(x)}{\partial x}\right)^{T}\mathbf{U}(x)}_{\mathbf{D}^{T}(x)}\mathbf{\Lambda}(x) \tag{6}$$

Denote  $\mathbf{D}(x) \triangleq \mathbf{U}(x)^T \frac{\partial \mathbf{U}(x)}{\partial x}$ . Since  $\mathbf{U}(x)\mathbf{U}(x)^T = \mathbf{I}$ , differentiating both sides with respect to x leads to,

$$\mathbf{U}(x)^{T} \frac{\partial \mathbf{U}(x)}{\partial x} + \left(\frac{\partial \mathbf{U}(x)}{\partial x}\right)^{T} \mathbf{U}(x) = \mathbf{0}$$
  
$$\Rightarrow \mathbf{D}(x) + \mathbf{D}^{T}(x) = \mathbf{0}$$

It is seen that  $\mathbf{D}(x)$  is a skew symmetric matrix whose diagonal elements are zeros. Moreover, since  $\Lambda(x)$  is diagonal, the last two items of the right side of (6) sum to zero on diagonal positions. Only considering the diagonal elements in (6) leads to

$$\frac{\partial \lambda_l(x)}{\partial x} = \mathbf{u}_l(x)^T \frac{\partial \mathbf{A}(x)}{\partial x} \mathbf{u}_l(x), l \in \{1, 2, 3\}$$
 (7)

which yields the first conclusion. Now we aims to prove the second one. In (6),  $\frac{\partial \mathbf{\Lambda}(x)}{\partial x}$  is diagonal matrix and thus for the off-diagonal, k-th row, l-th column, element  $(k \neq l)$ ,

$$0 = \mathbf{u}_k(x)^T \frac{\partial \mathbf{A}(x)}{\partial x} \mathbf{u}_l(x) + \lambda_k D_x^{k,l} - D_x^{k,l} \lambda_l$$
 (8)

where  $D_x^{k,l}$  is the k-th row, l-th column element in the skew symmetric  $\mathbf{D}(x)$  and satisfy  $D_x^{k,l}=-D_x^{l,k}$ . From (8), we can solve  $D_x^{k,l}$ 

$$D_x^{k,l} = \begin{cases} \frac{1}{\lambda_l - \lambda_k} \mathbf{u}_k(x)^T \frac{\partial \mathbf{A}(x)}{\partial x} \mathbf{u}_l(x), k \neq l \\ 0, k = l \end{cases}$$
(9)

Since  $\mathbf{D}(x) \triangleq \mathbf{U}(x)^T \frac{\partial \mathbf{U}(x)}{\partial x}$ , we have  $\frac{\partial \mathbf{U}(x)}{\partial x} = \mathbf{U}(x)\mathbf{D}(x)$ . Taking the l-th column on both sides leads to

$$\frac{\partial \mathbf{u}_l(x)}{\partial x} = \mathbf{U}(x)\mathbf{D}_x^{:,l},\tag{10}$$

where  $\mathbf{D}_{x}^{:,l} \in \mathbb{R}^{3}$  represents the l-th column of  $\mathbf{D}(x)$ . Finally, substituting  $\mathbf{U}(x) = [\mathbf{u}_1(x) \ \mathbf{u}_2(x) \ \mathbf{u}_3(x)]$  and (9) into (10), we obtain

$$\frac{\partial \mathbf{u}_l(x)}{\partial x} = \sum_{k=1, k \neq l}^3 \frac{1}{\lambda_l - \lambda_k} \mathbf{u}_k(x) \mathbf{u}_k(x)^T \frac{\partial \mathbf{A}(x)}{\partial x} \mathbf{u}_l(x), \quad (11)$$

which yields the second conclusion.

Lemma 2. Given

(1) Matrices 
$$\mathbf{C}_{j} = \begin{bmatrix} \mathbf{P}_{j} & \mathbf{v}_{j} \\ \mathbf{v}_{j}^{T} & N_{j} \end{bmatrix} \in \mathbb{S}^{4 \times 4}, j = 1, \cdots, M_{p};$$
  
(2) Poses  $\mathbf{T}_{j} \in SE(3), j = 1, \cdots, M_{p};$   
(3) A matrix  $\mathbf{C} = \begin{bmatrix} \mathbf{P} & \mathbf{v} \\ \mathbf{v}^{T} & N \end{bmatrix} \triangleq \sum_{j=1}^{M_{p}} \mathbf{T}_{j} \mathbf{C}_{j} \mathbf{T}_{j}^{T} \in \mathbb{S}^{4 \times 4}$  and

(3) A matrix 
$$\mathbf{C} = \begin{bmatrix} \mathbf{P} & \mathbf{v} \\ \mathbf{v}^T & N \end{bmatrix} \triangleq \sum_{j=1}^{M_p} \mathbf{T}_j \mathbf{C}_j \mathbf{T}_j^T \in \mathbb{S}^{4 \times 4}$$
 and a matrix function  $\mathbf{A}(\mathbf{C}) \triangleq \frac{1}{N} \mathbf{P} - \frac{1}{N^2} \mathbf{v} \mathbf{v}^T$ ;

(4) Two constant eigenvectors  $\mathbf{u}_k, \mathbf{u}_l \in \mathbb{R}^3$ 

then the first and second order derivatives of  $\mathbf{u}_k^T \mathbf{A}(\mathbf{T}) \mathbf{u}_l$  w.r.t. T are:

$$\mathbf{g}_{kl} \triangleq \frac{\partial \mathbf{u}_k^T \mathbf{A}(\delta \mathbf{T}) \mathbf{u}_l}{\partial \delta \mathbf{T}} = \begin{bmatrix} \cdots & \mathbf{g}_{kl}^q & \cdots \end{bmatrix} \in \mathbb{R}^{1 \times 6M_p}, \quad (12)$$

$$\mathbf{H}_{kl} \triangleq \frac{\partial^{2} \mathbf{u}_{k}^{T} \mathbf{A}(\delta \mathbf{T}) \mathbf{u}_{l}}{\partial (\delta \mathbf{T})^{2}} = \begin{bmatrix} \vdots & \vdots \\ \cdots & \mathbf{H}_{kl}^{\mathbf{p},\mathbf{q}} & \cdots \end{bmatrix} \in \mathbb{R}^{6M_{p} \times 6M_{p}}, \qquad = \frac{1}{N} \mathbf{S}_{\mathbf{P}} \left( \mathbf{C} - \frac{1}{N} \mathbf{C} \mathbf{S}_{\mathbf{v}}^{T} \mathbf{S}_{\mathbf{v}} \mathbf{C}^{T} \right) \mathbf{S}_{\mathbf{P}}^{T}$$

$$= \frac{1}{N} \mathbf{S}_{\mathbf{P}} \left( \sum_{\mathbf{T}} \mathbf{T}_{\mathbf{q}} \mathbf{C}_{\mathbf{q}} \mathbf{T}_{\mathbf{q}}^{T} \right)$$

where  $\mathbf{g}_{kl}^{\mathbf{q}} \in \mathbb{R}^{1 \times 6}$ ,  $\mathbf{H}_{kl}^{\mathbf{p},\mathbf{q}} \in \mathbb{R}^{6 \times 6}$ ,  $\forall \mathbf{p}, \mathbf{q} \in \{1, \cdots, M_p\}$ , are

$$\mathbf{K}_{kl}^{q} = \frac{1}{N} \lfloor \mathbf{S}_{\mathbf{P}} \mathbf{T}_{\mathbf{q}} \mathbf{C}_{\mathbf{q}} (\mathbf{T}_{\mathbf{q}} - \frac{1}{N} \mathbf{C} \mathbf{F})^{T} \mathbf{S}_{\mathbf{P}}^{T} \mathbf{u}_{k} \rfloor \lfloor \mathbf{u}_{l} \rfloor$$

$$+ \frac{1}{N} \lfloor \mathbf{u}_{k} \rfloor \lfloor \mathbf{S}_{\mathbf{P}} \mathbf{T}_{\mathbf{q}} \mathbf{C}_{\mathbf{q}} (\mathbf{T}_{\mathbf{q}} - \frac{1}{N} \mathbf{C} \mathbf{F})^{T} \mathbf{S}_{\mathbf{P}}^{T} \mathbf{u}_{l} \rfloor$$
 (16)

where

$$\mathbf{U}_{l} = \begin{bmatrix} -\lfloor \mathbf{u}_{l} \rfloor & \mathbf{0}_{3 \times 1} \\ \mathbf{0}_{3 \times 3} & \mathbf{u}_{l} \end{bmatrix} \quad \mathbf{F} = \begin{bmatrix} \mathbf{0}_{3 \times 3} & \mathbf{0}_{3 \times 1} \\ \mathbf{0}_{1 \times 3} & 1 \end{bmatrix}$$
(17)

$$\mathbf{S}_{\mathbf{P}} = \begin{bmatrix} \mathbf{I}_{3\times3} & \mathbf{0}_{3\times1} \end{bmatrix} \quad \mathbf{D}_{p,q} = \mathbf{C}_{p} \mathbf{F} \mathbf{C}_{q},$$
 (18)

and

$$\mathbf{g}_{kl}^{\mathbf{q}} = \mathbf{0}_{1\times 6}, \quad \mathbf{H}_{kl}^{\mathbf{p},\mathbf{q}} = \mathbf{0}_{6\times 6}, \forall k, l,$$
if  $\mathbf{p}$  or  $\mathbf{q} \in \mathcal{I} \triangleq \{j | 1 \le j \le M_p, \mathbf{C}_j = \mathbf{0}\}.$  (19)

*Proof.* Partition the matrix C as

$$\mathbf{C} = \begin{bmatrix} \mathbf{P} & \mathbf{v} \\ \mathbf{v}^T & N \end{bmatrix} = \sum_{j=1}^{M_p} \mathbf{T}_j \mathbf{C}_j \mathbf{T}_j^T, \tag{20}$$

then

$$\mathbf{P} = \mathbf{S}_{\mathbf{P}} \mathbf{C} \mathbf{S}_{\mathbf{P}}^{T} = \sum_{j=1}^{M_{p}} \left( \mathbf{R}_{j} \mathbf{P}_{j} \mathbf{R}_{j}^{T} + \mathbf{R}_{j} \mathbf{v}_{j} \mathbf{t}_{j}^{T} + \mathbf{t}_{j} \mathbf{v}_{j} \mathbf{t}_{j}^{T} + \mathbf{t}_{j} \mathbf{v}_{j} \mathbf{t}_{j}^{T} \right), \tag{21}$$

$$\mathbf{v} = \mathbf{S}_{\mathbf{P}} \mathbf{C} \mathbf{S}_{\mathbf{v}}^{T} = \sum_{j=1}^{M_{p}} (\mathbf{R}_{j} \mathbf{v}_{j} + N_{j} \mathbf{t}_{j}), N = \sum_{j=1}^{M_{p}} N_{j}, \quad (21)$$

$$\mathbf{S}_{\mathbf{P}} = \begin{bmatrix} \mathbf{I}_{3\times3} & \mathbf{0}_{3\times1} \end{bmatrix} \in \mathbb{R}^{3\times4}, \tag{23}$$

$$\mathbf{S_v} = \begin{bmatrix} \mathbf{0}_{1\times3} & 1 \end{bmatrix} \in \mathbb{R}^{1\times4}. \tag{24}$$

Therefore,

$$\mathbf{A}\left(\sum_{j=1}^{M_p} \mathbf{T}_j \mathbf{C}_j \mathbf{T}_j^T\right) = \frac{1}{N} \mathbf{P} - \frac{1}{N^2} \mathbf{v} \mathbf{v}^T$$
 (25)

$$= \frac{1}{N} \mathbf{S}_{\mathbf{P}} \left( \mathbf{C} - \frac{1}{N} \mathbf{C} \mathbf{S}_{\mathbf{v}}^{T} \mathbf{S}_{\mathbf{v}} \mathbf{C}^{T} \right) \mathbf{S}_{\mathbf{P}}^{T}$$
 (26)

$$\mathbf{E} = rac{1}{N}\mathbf{S_P}\left(\sum_{\mathsf{q}=1}^{M_p}\mathbf{T_\mathsf{q}}\mathbf{C_\mathsf{q}}\mathbf{T}_\mathsf{q}^T
ight)$$

$$-\frac{1}{N} \sum_{p=1}^{M_p} \sum_{q=1}^{M_p} \mathbf{T}_p \mathbf{C}_p \mathbf{T}_p^T \mathbf{S}_{\mathbf{v}}^T \mathbf{S}_{\mathbf{v}} \mathbf{T}_q \mathbf{C}_q \mathbf{T}_q^T \right) \mathbf{S}_{\mathbf{P}}^T.$$
(27)

Since 
$$\mathbf{T}_{p}^{T}\mathbf{S}_{\mathbf{v}}^{T}\mathbf{S}_{\mathbf{v}}\mathbf{T}_{q} = \begin{bmatrix} \mathbf{0}_{3\times3} & \mathbf{0}_{3\times1} \\ \mathbf{0}_{1\times3} & 1 \end{bmatrix}$$
, we obtain

$$\mathbf{A} = \frac{1}{N} \mathbf{S}_{\mathbf{P}} \left( \sum_{\mathbf{q}=1}^{M_p} \mathbf{T}_{\mathbf{q}} \mathbf{C}_{\mathbf{q}} \mathbf{T}_{\mathbf{q}}^T - \frac{1}{N} \sum_{\mathbf{p}=1}^{M_p} \sum_{\mathbf{q}=1}^{M_p} \mathbf{T}_{\mathbf{p}} \mathbf{D}_{\mathbf{p}, \mathbf{q}} \mathbf{T}_{\mathbf{q}}^T \right) \mathbf{S}_{\mathbf{P}}^T, (28)$$

$$+\begin{bmatrix} \mathbf{K}_{kl}^{\mathbf{q}} & \mathbf{0}_{3\times 3} \\ \mathbf{0}_{3\times 3} & \mathbf{0}_{3\times 3} \end{bmatrix} ) \quad \mathbf{D}_{p,q} = \mathbf{C}_{p} \mathbf{F} \mathbf{C}_{q}, \quad \mathbf{F} = \begin{bmatrix} \mathbf{0}_{3\times 3} & \mathbf{0}_{3\times 1} \\ \mathbf{0}_{1\times 3} & 1 \end{bmatrix}$$
 (29)

where we omitted the input argument of A for the sake of notation simplicity. Since  $N = \sum_{j=1}^{M_p} N_j$  is a constant number that is irrelevant to the pose **T**, perturbing the input of **A**, which is the pose vector  $\mathbf{T}$ , by  $\delta \mathbf{T}$  yields

$$\mathbf{u}_{k}^{T}\mathbf{A}(\delta\mathbf{T})\mathbf{u}_{l}\!=\!\frac{1}{N}\mathbf{u}_{k}^{T}\mathbf{S}_{P}\!\left(\sum_{\mathbf{q}=1}^{M_{p}}\left(\mathbf{T}_{\mathbf{q}}\boxplus\delta\mathbf{T}_{\mathbf{q}}\right)\mathbf{C}_{\mathbf{q}}\left(\mathbf{T}_{\mathbf{q}}\boxplus\delta\mathbf{T}_{\mathbf{q}}\right)^{T}\!$$

(17) 
$$\mathbf{u}_{k}^{T}\mathbf{A}(\delta\mathbf{T})\mathbf{u}_{l} = \frac{1}{N}\mathbf{u}_{k}^{T}\mathbf{S}_{\mathbf{P}}\left(\sum_{q=1}^{M_{p}}\left(\mathbf{T}_{q} \boxplus \delta\mathbf{T}_{q}\right)\mathbf{C}_{q}\left(\mathbf{T}_{q} \boxplus \delta\mathbf{T}_{q}\right)^{T}\right) \\ -\frac{1}{N}\sum_{p=1}^{M_{p}}\sum_{q=1}^{M_{p}}\left(\mathbf{T}_{p} \boxplus \delta\mathbf{T}_{p}\right)\mathbf{D}_{p,q}\left(\mathbf{T}_{q} \boxplus \delta\mathbf{T}_{q}\right)^{T}\mathbf{S}_{\mathbf{P}}^{T}\mathbf{u}_{l}.$$
(30)

Based on the definition of  $\boxplus$  on SE(3) in (27), we define,

$$\mathbf{w}_{ql}(\delta \mathbf{T}_{q}) \triangleq (\mathbf{T}_{q} \boxplus \delta \mathbf{T}_{q})^{T} \mathbf{S}_{\mathbf{p}}^{T} \mathbf{u}_{l}$$

$$= \begin{bmatrix} \mathbf{R}_{q}^{T} \exp^{T}(\lfloor \delta \boldsymbol{\phi}_{q} \rfloor) \mathbf{u}_{l} \\ \mathbf{t}_{q}^{T} \exp^{T}(\lfloor \delta \boldsymbol{\phi}_{q} \rfloor) \mathbf{u}_{l} + \mathbf{u}_{l}^{T} \delta \mathbf{t}_{q} \end{bmatrix}$$
(31)

When  $\delta \phi_{\rm q}$  is small, which is indeed the case for the purpose of derivative computation, we have

$$\exp(\lfloor \delta \phi_{\mathbf{q}} \rfloor) \approx \mathbf{I} + \lfloor \delta \phi_{\mathbf{q}} \rfloor + \frac{1}{2} \lfloor \delta \phi_{\mathbf{q}} \rfloor^{2}$$
 (32)

Substituting (32) into  $\mathbf{w}_{ql}(\delta \mathbf{T}_q)$ , we obtain

$$\mathbf{w}_{ql}(\delta \mathbf{T}_{q}) \approx \begin{bmatrix} \mathbf{R}_{q}^{T} (\mathbf{I} - \lfloor \delta \boldsymbol{\phi}_{q} \rfloor + \frac{1}{2} \lfloor \delta \boldsymbol{\phi}_{q} \rfloor^{2}) \mathbf{u}_{l} \\ \mathbf{t}_{q}^{T} (\mathbf{I} - \lfloor \delta \boldsymbol{\phi}_{q} \rfloor + \frac{1}{2} \lfloor \delta \boldsymbol{\phi}_{q} \rfloor^{2}) \mathbf{u}_{l} + \mathbf{u}_{l}^{T} \delta \mathbf{t}_{q} \end{bmatrix} \\ \approx \underbrace{\begin{bmatrix} \mathbf{R}_{q}^{T} \mathbf{u}_{l} \\ \mathbf{t}_{q}^{T} \mathbf{u}_{l} \end{bmatrix}}_{\mathbf{\bar{w}}_{ql}} + \underbrace{\begin{bmatrix} \mathbf{R}_{q}^{T} \lfloor \mathbf{u}_{l} \rfloor & \mathbf{0}_{3 \times 3} \\ \mathbf{t}_{q}^{T} \lfloor \mathbf{u}_{l} \rfloor & \mathbf{u}_{l}^{T} \end{bmatrix}}_{\mathbf{J}_{\mathbf{w}_{ql}} \in \mathbb{R}^{4 \times 6}} \underbrace{\begin{bmatrix} \delta \boldsymbol{\phi}_{q} \\ \delta \mathbf{t}_{q} \end{bmatrix}}_{\delta \mathbf{T}_{q}} + \underbrace{\begin{bmatrix} \frac{1}{2} \mathbf{R}_{q}^{T} \lfloor \delta \boldsymbol{\phi}_{q} \rfloor^{2} \mathbf{u}_{l} \\ \frac{1}{2} \mathbf{t}_{q}^{T} \lfloor \delta \boldsymbol{\phi}_{q} \rfloor^{2} \mathbf{u}_{l} \end{bmatrix}}_{\delta \mathbf{\Phi}_{ql}}$$

$$(33)$$

where  $\bar{\mathbf{w}}_{\text{q}l}$ ,  $\delta\mathbf{\Phi}_{\text{q}l}$  and  $\mathbf{J}_{\mathbf{w}_{\text{q}l}}$  can be simplified

$$\bar{\mathbf{w}}_{ql} = (\mathbf{S}_{\mathbf{P}} \mathbf{T}_{q})^{T} \mathbf{u}_{l} \quad \delta \mathbf{\Phi}_{ql} = \frac{1}{2} (\mathbf{S}_{\mathbf{P}} \mathbf{T}_{q})^{T} \lfloor \delta \boldsymbol{\phi}_{q} \rfloor^{2} \mathbf{u}_{l}$$

$$\mathbf{J}_{\mathbf{w}_{ql}} = \mathbf{T}_{q}^{T} \mathbf{U}_{l}^{T} \quad \mathbf{U}_{l} = \begin{bmatrix} -\lfloor \mathbf{u}_{l} \rfloor & \mathbf{0}_{3 \times 1} \\ \mathbf{0}_{3 \times 3} & \mathbf{u}_{l} \end{bmatrix}$$
(34)

Substituting (33) into (30) and keeping terms up to the second order lead to

$$\mathbf{u}_{k}^{T} \mathbf{A}(\delta \mathbf{T}) \mathbf{u}_{l} = \frac{1}{N} \sum_{q=1}^{M_{p}} \mathbf{w}_{qk}^{T}(\delta \mathbf{T}_{q}) \mathbf{C}_{q} \mathbf{w}_{ql}(\delta \mathbf{T}_{q})$$

$$- \frac{1}{N^{2}} \sum_{p=1}^{M_{p}} \sum_{q=1}^{M_{p}} \mathbf{w}_{pk}^{T}(\delta \mathbf{T}_{p}) \mathbf{D}_{p,q} \mathbf{w}_{ql}(\delta \mathbf{T}_{q}) \quad (35)$$

$$= \frac{1}{N} \sum_{q=1}^{M_{p}} \left( (\bar{\mathbf{w}}_{qk}^{T} \mathbf{C}_{q} \mathbf{J}_{\mathbf{w}_{ql}} + \bar{\mathbf{w}}_{ql}^{T} \mathbf{C}_{q} \mathbf{J}_{\mathbf{w}_{qk}}) \delta \mathbf{T}_{q} + \bar{\mathbf{w}}_{qk}^{T} \mathbf{C}_{q} \bar{\mathbf{w}}_{ql} \right)$$

$$+ \delta \mathbf{T}_{q}^{T} \mathbf{J}_{\mathbf{w}_{qk}}^{T} \mathbf{C}_{q} \mathbf{J}_{\mathbf{w}_{ql}} \delta \mathbf{T}_{q} + \underbrace{\bar{\mathbf{w}}_{qk}^{T} \mathbf{C}_{q} \delta \mathbf{\Phi}_{ql} + \delta \mathbf{\Phi}_{qk}^{T} \mathbf{C}_{q} \bar{\mathbf{w}}_{ql}}_{\frac{1}{2} \delta \mathbf{T}_{q}^{T} \mathbf{Q}_{kl}^{q} \delta \mathbf{T}_{q}}$$

$$- \frac{1}{N^{2}} \sum_{p=1}^{M_{p}} \sum_{q=1}^{M_{p}} \left( \delta \mathbf{T}_{p}^{T} \mathbf{J}_{\mathbf{w}_{pk}}^{T} \mathbf{D}_{p,q} \mathbf{J}_{\mathbf{w}_{ql}} \delta \mathbf{T}_{q} + \bar{\mathbf{w}}_{pk}^{T} \mathbf{D}_{p,q} \mathbf{J}_{\mathbf{w}_{ql}} \delta \mathbf{T}_{q} \right)$$

$$+ \delta \mathbf{T}_{p}^{T} \mathbf{J}_{\mathbf{w}_{pk}}^{T} \mathbf{D}_{p,q} \bar{\mathbf{w}}_{ql} + \bar{\mathbf{w}}_{pk}^{T} \mathbf{D}_{p,q} \bar{\mathbf{w}}_{ql}$$

$$+ \underbrace{\bar{\mathbf{w}}_{pk}^{T} \mathbf{D}_{p,q} \delta \mathbf{\Phi}_{ql}}_{\frac{1}{2}} + \underbrace{\delta \mathbf{\Phi}_{pk}^{T} \mathbf{D}_{p,q} \bar{\mathbf{w}}_{ql}}_{\frac{1}{2} \delta \mathbf{T}_{p}^{T} \mathbf{M}_{kl}^{p,q} \delta \mathbf{T}_{p}}_{\frac{1}{2} \delta \mathbf{T}_{p}^{T} \mathbf{M}_{kl}^{p,q} \delta \mathbf{T}_{p}} \right). \quad (36)$$

To compute  $\mathbf{Q}_{kl}^{\mathrm{q}}$  in  $\frac{1}{2}\delta\mathbf{T}_{\mathrm{q}}^{T}\mathbf{Q}_{kl}^{\mathrm{q}}\delta\mathbf{T}_{\mathrm{q}}$ , note that  $\mathbf{a}^{T}\lfloor\delta\boldsymbol{\phi}\rfloor^{2}\mathbf{b} = \delta\boldsymbol{\phi}^{T}\lfloor\mathbf{a}\rfloor\lfloor\mathbf{b}\rfloor\delta\boldsymbol{\phi}, \forall \mathbf{a}, \mathbf{b}, \delta\boldsymbol{\phi} \in \mathbb{R}^{3}$ , we have

$$\bar{\mathbf{w}}_{qk}^{T} \mathbf{C}_{q} \delta \mathbf{\Phi}_{ql} = \frac{1}{2} \mathbf{u}_{k}^{T} \mathbf{S}_{\mathbf{P}} \mathbf{T}_{q} \mathbf{C}_{q} \mathbf{T}_{q}^{T} \mathbf{S}_{\mathbf{P}}^{T} \lfloor \delta \boldsymbol{\phi}_{q} \rfloor^{2} \mathbf{u}_{l}$$

$$= \frac{1}{2} \delta \boldsymbol{\phi}_{q}^{T} \lfloor \mathbf{S}_{\mathbf{P}} \mathbf{T}_{q} \mathbf{C}_{q} \mathbf{T}_{q}^{T} \mathbf{S}_{\mathbf{P}}^{T} \mathbf{u}_{k} \rfloor \lfloor \mathbf{u}_{l} \rfloor \delta \boldsymbol{\phi}_{q}. \quad (37)$$

Similarly,

$$\delta \mathbf{\Phi}_{\mathbf{q}k}^{T} \mathbf{C}_{\mathbf{q}} \bar{\mathbf{w}}_{\mathbf{q}l} = \frac{1}{2} \delta \boldsymbol{\phi}_{\mathbf{q}}^{T} \lfloor \mathbf{u}_{k} \rfloor \lfloor \mathbf{S}_{\mathbf{P}} \mathbf{T}_{\mathbf{q}} \mathbf{C}_{\mathbf{q}} \mathbf{T}_{\mathbf{q}}^{T} \mathbf{S}_{\mathbf{P}}^{T} \mathbf{u}_{l} \rfloor \delta \boldsymbol{\phi}_{\mathbf{q}}.$$
(38)

Summing (37) and (38) and extending the  $\delta \phi$  into  $\delta T$ :

$$\mathbf{Q}_{kl}^{\mathbf{q}} = \begin{bmatrix} [\mathbf{S}_{\mathbf{P}} \mathbf{T}_{\mathbf{q}} \mathbf{C}_{\mathbf{q}} \mathbf{T}_{\mathbf{q}}^{T} \mathbf{S}_{\mathbf{P}}^{T} \mathbf{u}_{k}] [\mathbf{u}_{l}] + [\mathbf{u}_{k}] [\mathbf{S}_{\mathbf{P}} \mathbf{T}_{\mathbf{q}} \mathbf{C}_{\mathbf{q}} \mathbf{T}_{\mathbf{q}}^{T} \mathbf{S}_{\mathbf{P}}^{T} \mathbf{u}_{l}] & \mathbf{0} \\ \mathbf{0} & \mathbf{0} \end{bmatrix}$$
(39)

For  $\frac{1}{2}\delta\mathbf{T}_{q}^{T}\mathbf{N}_{kl}^{p,q}\delta\mathbf{T}_{q}$  and  $\frac{1}{2}\delta\mathbf{T}_{p}^{T}\mathbf{M}_{kl}^{p,q}\delta\mathbf{T}_{p}$ ,

$$\bar{\mathbf{w}}_{pk}^{T} \mathbf{D}_{p,q} \delta \mathbf{\Phi}_{ql} = \frac{1}{2} \mathbf{u}_{k}^{T} \mathbf{S}_{\mathbf{P}} \mathbf{T}_{p} \mathbf{D}_{p,q} \mathbf{T}_{q}^{T} \mathbf{S}_{\mathbf{P}}^{T} \lfloor \delta \boldsymbol{\phi}_{q} \rfloor^{2} \mathbf{u}_{l} 
= \frac{1}{2} \delta \boldsymbol{\phi}_{q}^{T} \lfloor \mathbf{S}_{\mathbf{P}} \mathbf{T}_{q} \mathbf{D}_{q,p} \mathbf{T}_{p}^{T} \mathbf{S}_{\mathbf{P}}^{T} \mathbf{u}_{k} \rfloor \lfloor \mathbf{u}_{l} \rfloor \delta \boldsymbol{\phi}_{q} \quad (40) 
\delta \mathbf{\Phi}_{pk}^{T} \mathbf{D}_{p,q} \bar{\mathbf{w}}_{ql} = \frac{1}{2} \mathbf{u}_{k}^{T} \lfloor \delta \boldsymbol{\phi}_{p} \rfloor^{2} \mathbf{S}_{\mathbf{P}} \mathbf{T}_{p} \mathbf{D}_{p,q} \mathbf{T}_{q}^{T} \mathbf{S}_{\mathbf{P}}^{T} \mathbf{u}_{l} 
= \frac{1}{2} \delta \boldsymbol{\phi}_{p}^{T} \lfloor \mathbf{u}_{k} \rfloor \lfloor \mathbf{S}_{\mathbf{P}} \mathbf{T}_{p} \mathbf{D}_{p,q} \mathbf{T}_{q}^{T} \mathbf{S}_{\mathbf{P}}^{T} \mathbf{u}_{l} \rfloor \delta \boldsymbol{\phi}_{p} \quad (41)$$

where  $\mathbf{D}_{q,p} = \mathbf{D}_{p,q}^T$ . Thus, extending the  $\delta \boldsymbol{\phi}$  into  $\delta \mathbf{T}$ , we obtain

$$\mathbf{N}_{kl}^{\mathrm{p,q}} = \begin{bmatrix} \begin{bmatrix} \mathbf{S}_{\mathbf{P}} \mathbf{T}_{\mathbf{q}} \mathbf{D}_{\mathbf{q,p}} \mathbf{T}_{\mathbf{p}}^T \mathbf{S}_{\mathbf{p}}^T \mathbf{u}_k \end{bmatrix} \begin{bmatrix} \mathbf{u}_l \end{bmatrix} & \mathbf{0}_{3 \times 3} \\ \mathbf{0}_{3 \times 3} & \mathbf{0}_{3 \times 3} \end{bmatrix}$$
(42)

$$\mathbf{M}_{kl}^{\mathbf{p},\mathbf{q}} = \begin{bmatrix} \lfloor \mathbf{u}_{k} \rfloor \lfloor \mathbf{S}_{\mathbf{P}} \mathbf{T}_{\mathbf{p}} \mathbf{D}_{\mathbf{p},\mathbf{q}} \mathbf{T}_{\mathbf{q}}^{T} \mathbf{S}_{\mathbf{p}}^{T} \mathbf{u}_{l} \rfloor & \mathbf{0}_{3 \times 3} \\ \mathbf{0}_{3 \times 3} & \mathbf{0}_{3 \times 3} \end{bmatrix}$$
(43)

It can be seen that (36) is quadratic w.r.t.  $\delta T$ , so we cast it into the following standard form

$$\mathbf{u}_{k}^{T} \mathbf{A}(\delta \mathbf{T}) \mathbf{u}_{l} = \frac{1}{2} \delta \mathbf{T}^{T} \cdot \mathbf{H}_{kl} \cdot \delta \mathbf{T} + \mathbf{g}_{kl} \cdot \delta \mathbf{T} + r_{kl}, \quad (44)$$

where  $\mathbf{g}_{kl}$  is

$$\mathbf{g}_{kl} = \begin{bmatrix} \cdots & \mathbf{g}_{kl}^{q} & \cdots \end{bmatrix} \in \mathbb{R}^{1 \times 6M_{p}}$$

$$\mathbf{g}_{kl}^{q} = \frac{1}{N} (\bar{\mathbf{w}}_{qk}^{T} \mathbf{C}_{q} \mathbf{J}_{\mathbf{w}_{ql}} + \bar{\mathbf{w}}_{ql}^{T} \mathbf{C}_{q} \mathbf{J}_{\mathbf{w}_{qk}})$$

$$- \frac{1}{N^{2}} \sum_{p=1}^{M_{p}} (\bar{\mathbf{w}}_{pk}^{T} \mathbf{D}_{p,q} \mathbf{J}_{\mathbf{w}_{ql}} + \bar{\mathbf{w}}_{pl}^{T} \mathbf{D}_{p,q} \mathbf{J}_{\mathbf{w}_{qk}})$$

$$= \frac{1}{N} (\mathbf{u}_{k}^{T} \mathbf{S}_{\mathbf{P}} \mathbf{T}_{q} \mathbf{C}_{q} \mathbf{T}_{q}^{T} \mathbf{U}_{l}^{T} + \mathbf{u}_{l}^{T} \mathbf{S}_{\mathbf{P}} \mathbf{T}_{q} \mathbf{C}_{q} \mathbf{T}_{q}^{T} \mathbf{U}_{k}^{T})$$

$$- \frac{1}{N^{2}} \sum_{p=1}^{M_{p}} (\mathbf{u}_{k}^{T} \mathbf{S}_{\mathbf{P}} \mathbf{T}_{p} \mathbf{C}_{p,q} \mathbf{T}_{q}^{T} \mathbf{U}_{l}^{T} + \mathbf{u}_{l}^{T} \mathbf{S}_{\mathbf{P}} \mathbf{T}_{p} \mathbf{D}_{p,q} \mathbf{T}_{q}^{T} \mathbf{U}_{k}^{T})$$

$$= \frac{1}{N} \mathbf{u}_{l}^{T} \mathbf{S}_{\mathbf{P}} (\mathbf{T}_{q} \mathbf{C}_{q} - \frac{1}{N} \sum_{p=1}^{M_{p}} \mathbf{T}_{p} \mathbf{D}_{p,q}) \mathbf{T}_{q}^{T} \mathbf{U}_{k}^{T}$$

$$+ \frac{1}{N} \mathbf{u}_{k}^{T} \mathbf{S}_{\mathbf{P}} (\mathbf{T}_{q} \mathbf{C}_{q} - \frac{1}{N} \sum_{p=1}^{M_{p}} \mathbf{T}_{p} \mathbf{D}_{p,q}) \mathbf{T}_{q}^{T} \mathbf{U}_{l}^{T}$$

$$(47)$$

where 
$$\mathbf{D}_{\mathrm{p,q}} = \mathbf{C}_{\mathrm{p}} \mathbf{F} \mathbf{C}_{\mathrm{q}}$$
 and  $\mathbf{F} = \begin{bmatrix} \mathbf{0}_{3 \times 1} & \mathbf{0}_{3 \times 1} \\ \mathbf{0}_{1 \times 3} & 1 \end{bmatrix}$ .

Since  $\mathbf{v} = \sum_{j=1}^{M_p} (\mathbf{R}_j \mathbf{v}_j + N_j \mathbf{t}_j)$ ,

 $\mathbf{V}_{\mathbf{p}} \mathbf{T}_{\mathbf{r}} \mathbf{C}_{\mathbf{r}} \mathbf{F} = \sum_{j=1}^{M_p} \begin{bmatrix} \mathbf{R}_{\mathrm{p}} & \mathbf{t}_{\mathrm{p}} \end{bmatrix} \begin{bmatrix} \mathbf{P}_{\mathrm{p}} & \mathbf{v}_{\mathrm{p}} \end{bmatrix} \begin{bmatrix} \mathbf{0}_{3 \times 1} & \mathbf{0}_{3 \times 1} \end{bmatrix}$ 

$$\sum_{p=1}^{M_p} \mathbf{T}_p \mathbf{C}_p \mathbf{F} = \sum_{p=1}^{M_p} \begin{bmatrix} \mathbf{R}_p & \mathbf{t}_p \\ \mathbf{0} & 1 \end{bmatrix} \begin{bmatrix} \mathbf{P}_p & \mathbf{v}_p \\ \mathbf{v}_p^T & N_p \end{bmatrix} \begin{bmatrix} \mathbf{0}_{3 \times 1} & \mathbf{0}_{3 \times 1} \\ \mathbf{0}_{1 \times 3} & 1 \end{bmatrix}$$
$$= \sum_{p=1}^{M_p} \begin{bmatrix} \mathbf{0}_{3 \times 1} & \mathbf{R}_p \mathbf{v}_p + N_p \mathbf{t}_p \\ \mathbf{0}_{1 \times 3} & N_p \end{bmatrix} = \begin{bmatrix} \mathbf{0} & \mathbf{v} \\ \mathbf{0} & N_p \end{bmatrix} = \mathbf{CF}. \quad (48)$$

The common part in (47) is

$$\mathbf{T}_{\mathbf{q}}\mathbf{C}_{\mathbf{q}} - \frac{1}{N} \sum_{p=1}^{M_p} \mathbf{T}_{\mathbf{p}} \mathbf{D}_{\mathbf{p},\mathbf{q}} = \mathbf{T}_{\mathbf{q}} \mathbf{C}_{\mathbf{q}} - \frac{1}{N} \underbrace{\sum_{p=1}^{M_p} \mathbf{T}_{\mathbf{p}} \mathbf{C}_{\mathbf{p}} \mathbf{F}}_{\mathbf{C}\mathbf{F}} \mathbf{C}_{\mathbf{q}}$$

$$= (\mathbf{T}_{\mathbf{q}} - \frac{1}{N} \mathbf{C} \mathbf{F}) \mathbf{C}_{\mathbf{q}}. \tag{49}$$

Therefore.

$$\mathbf{g}_{kl}^{\mathbf{q}} = \frac{1}{N} \mathbf{u}_{l}^{T} \mathbf{S}_{\mathbf{P}} (\mathbf{T}_{\mathbf{q}} - \frac{1}{N} \mathbf{C} \mathbf{F}) \mathbf{C}_{\mathbf{q}} \mathbf{T}_{\mathbf{q}}^{T} \mathbf{U}_{k}^{T}$$

$$+ \frac{1}{N} \mathbf{u}_{k}^{T} \mathbf{S}_{\mathbf{P}} (\mathbf{T}_{\mathbf{q}} - \frac{1}{N} \mathbf{C} \mathbf{F}) \mathbf{C}_{\mathbf{q}} \mathbf{T}_{\mathbf{q}}^{T} \mathbf{U}_{l}^{T}.$$
 (50)

Additionally, it is seen that if  $\mathbf{C}_{\mathbf{q}} = \mathbf{0}_{4\times 4}$ ,  $\mathbf{g}_{kl}^{\mathbf{q}} = \mathbf{0}_{1\times 6}, \forall k, l$ . For  $\mathbf{H}_{kl}$  in (44), partition it as

$$\mathbf{H}_{kl} = \begin{vmatrix} \vdots \\ \cdots \\ \mathbf{H}_{kl}^{p,q} \\ \vdots \end{vmatrix} \in \mathbb{R}^{6M_p \times 6M_p}$$
 (51)

$$\mathbf{H}_{kl}^{p,q} = -\frac{2}{N^2} \mathbf{J}_{\mathbf{w}_{pk}}^T \mathbf{D}_{p,q} \mathbf{J}_{\mathbf{w}_{ql}} + \mathbb{1}_{p=q} \left( \frac{2}{N} \mathbf{J}_{\mathbf{w}_{qk}}^T \mathbf{C}_{q} \mathbf{J}_{\mathbf{w}_{ql}} + \frac{1}{N^2} \mathbf{Q}_{kl}^q - \frac{1}{N^2} \sum_{\nu=1}^{M_p} (\mathbf{N}_{kl}^{\nu,q} + \mathbf{M}_{kl}^{q,\nu}) \right)$$
(52)

where

$$\mathbf{J}_{\mathbf{w}_{pk}}^{T}\mathbf{D}_{p,q}\mathbf{J}_{\mathbf{w}_{ql}} = \mathbf{U}_{k}\mathbf{T}_{p}\mathbf{D}_{p,q}\mathbf{T}_{q}^{T}\mathbf{U}_{l}^{T}$$
(53)

$$\mathbf{J}_{\mathbf{w}_{qk}}^T \mathbf{C}_{q} \mathbf{J}_{\mathbf{w}_{ql}} = \mathbf{U}_k \mathbf{T}_{q} \mathbf{C}_{q} \mathbf{T}_{q}^T \mathbf{U}_{l}^T$$
(54)

$$\sum_{\nu=1}^{M_p} (\mathbf{N}_{kl}^{\nu,q} + \mathbf{M}_{kl}^{q,\nu}) = \sum_{\nu=1}^{M_p} \begin{bmatrix} [\mathbf{S}_{\mathbf{P}} \mathbf{T}_{\mathbf{q}} \mathbf{D}_{\mathbf{q},\nu} \mathbf{T}_{\nu}^T \mathbf{S}_{\mathbf{P}}^T \mathbf{u}_{k}] [\mathbf{u}_{l}] + [\mathbf{u}_{k}] [\mathbf{S}_{\mathbf{P}} \mathbf{T}_{\mathbf{q}} \mathbf{D}_{\mathbf{q},\nu} \mathbf{T}_{\nu}^T \mathbf{S}_{\mathbf{P}}^T \mathbf{u}_{l}] & \mathbf{0} \\ \mathbf{0} & \mathbf{0} \end{bmatrix}$$
(55)

By using similar method in (48), we have

$$\sum_{\nu=1}^{M_p} \mathbf{D}_{q,\nu} \mathbf{T}_{\nu}^T = \sum_{\nu=1}^{M_p} \mathbf{C}_{q} \mathbf{F} \mathbf{C}_{\nu} \mathbf{T}_{\nu}^T = \mathbf{C}_{q} \mathbf{F} \mathbf{C}$$
 (56)

The value of  $\mathbf{Q}_{kl}^{q}$  is in (39). Thus, the matrix  $\mathbf{H}_{kl}^{p,q}$  is

$$\mathbf{H}_{kl}^{p,q} = -\frac{2}{N^2} \mathbf{U}_k \mathbf{T}_p \mathbf{D}_{p,q} \mathbf{T}_q^T \mathbf{U}_l^T + \mathbb{1}_{p=q} \left( \frac{2}{N} \mathbf{U}_k \mathbf{T}_q \mathbf{C}_q \mathbf{T}_q^T \mathbf{U}_l^T + \begin{bmatrix} \mathbf{K}_{kl}^q & \mathbf{0}_{3\times 3} \\ \mathbf{0}_{3\times 3} & \mathbf{0}_{3\times 3} \end{bmatrix} \right)$$
(57)

$$\mathbf{K}_{kl}^{\mathbf{q}} = \frac{1}{N} \mathbf{Q}_{kl}^{\mathbf{q}} - \frac{1}{N^2} \sum_{\nu=1}^{M_p} (\mathbf{N}_{kl}^{\nu,\mathbf{q}} + \mathbf{M}_{kl}^{\mathbf{q},\nu})$$

$$= \frac{1}{N} [\mathbf{S}_{\mathbf{P}} \mathbf{T}_{\mathbf{q}} \mathbf{C}_{\mathbf{q}} (\mathbf{T}_{\mathbf{q}} - \frac{1}{N} \mathbf{C} \mathbf{F})^T \mathbf{S}_{\mathbf{P}}^T \mathbf{u}_k] [\mathbf{u}_l]$$

$$+ \frac{1}{N} [\mathbf{u}_k] [\mathbf{S}_{\mathbf{P}} \mathbf{T}_{\mathbf{q}} \mathbf{C}_{\mathbf{q}} (\mathbf{T}_{\mathbf{q}} - \frac{1}{N} \mathbf{C} \mathbf{F})^T \mathbf{S}_{\mathbf{P}}^T \mathbf{u}_l], \quad (58)$$

which yields the solution. Additionally, it can be seen that if  $\mathbf{C}_q = \mathbf{0}_{4\times 4}$  or  $\mathbf{C}_p = \mathbf{0}_{4\times 4}$ , we have  $\mathbf{D}_{p,q} = \mathbf{C}_p \mathbf{F} \mathbf{C}_q = \mathbf{0}_{4\times 4}$ ,  $\mathbf{K}_{kl}^q = \mathbf{0}_{3\times 3}$  and then  $\mathbf{H}_{kl}^{p,q} = \mathbf{0}_{6\times 6}, \forall k,l$ .

## II. PROOF OF THEOREMS

A. Proof of formula (6) and (8)

*Proof.* The variable to be optimized is  $\pi_i = (\mathbf{n}_i, \mathbf{q}_i)$  and the cost function is

$$c_i = \min_{\boldsymbol{\pi}_i = (\mathbf{n}_i, \mathbf{q}_i)} \left( \frac{1}{N_i} \sum_{j=1}^{M_p} \sum_{k=1}^{N_{ij}} \left\| \mathbf{h}_i^T (\mathbf{p}_{ijk} - \mathbf{q}_i) \right\|_2^2 \right)$$
(59)

where  $\mathbf{h}_i = \mathbf{n}_i$  for plane feature and  $\mathbf{h}_i = (\mathbf{I} - \mathbf{n}_i \mathbf{n}_i^T)$  for edge feature. The dimensions of  $\mathbf{h}_i$  may be different for these two features but it has no influence on following derivation.

$$c_i = \min_{\mathbf{q}_i} \min_{\mathbf{q}_i} \left( \frac{1}{N_i} \sum_{j=1}^{M_p} \sum_{k=1}^{N_{ij}} \left\| \mathbf{h}_i^T (\mathbf{p}_{ijk} - \mathbf{q}_i) \right\|_2^2 \right)$$
(60)

$$= \min_{\mathbf{q}_i} \left( \min_{\mathbf{q}_i} \left( \frac{1}{N_i} \sum_{j=1}^{M_p} \sum_{k=1}^{N_{ij}} (\mathbf{p}_{ijk} - \mathbf{q}_i)^T \mathbf{h}_i \mathbf{h}_i^T (\mathbf{p}_{ijk} - \mathbf{q}_i) \right) \right).$$

As can be seen, the inner optimization on  $\mathbf{q}_i$  is a standard quadratic optimization problem. So, the optimum  $\mathbf{q}_i^{\star}$  can be solved by setting the derivative to zero:

$$2\sum_{j=1}^{M_p} \sum_{k=1}^{N_{ij}} \mathbf{h}_i \mathbf{h}_i^T (\mathbf{p}_{ijk} - \mathbf{q}_i) = \mathbf{0} \implies$$

$$2\mathbf{h}_i \mathbf{h}_i^T \left( \sum_{j=1}^{M_p} \sum_{k=1}^{N_{ij}} \mathbf{p}_{ijk} - N_i \mathbf{q}_i \right) = \mathbf{0}$$
(61)

where  $N_i = \sum_{j=1}^{M_p} \sum_{k=1}^{N_{ij}} 1 = \sum_{j=1}^{M_p} N_{ij}$ . This equation does not lead to a unique solution of  $\mathbf{q}_i$ , one particular optimum solution is  $\mathbf{q}_i^{\star} = \frac{1}{N_i} \sum_{j=1}^{M_p} \sum_{k=1}^{N_{ij}} \mathbf{p}_{ijk} = \bar{\mathbf{p}}_i$  as is defined in (7).

Now, substituting the optimum solution  $\mathbf{q}_i^{\star} = \bar{\mathbf{p}}_i$  into (60) leads to:

$$c_{i} = \min_{\mathbf{n}_{i}} \left( \frac{1}{N_{i}} \sum_{j=1}^{M_{p}} \sum_{k=1}^{N_{ij}} \left\| \mathbf{h}_{i}^{T} (\mathbf{p}_{ijk} - \bar{\mathbf{p}}_{i}) \right\|_{2}^{2} \right)$$
(62)

To solve for the optimal parameter  $\mathbf{n}_i$  in the above optimization problem, we discuss the case of plane and edge features separately, as follows.

1) Plane feature:  $\mathbf{h}_i = \mathbf{n}_i$ .

$$c_{i} = \min_{\|\mathbf{n}_{i}\|_{2}=1} \left( \frac{1}{N_{i}} \sum_{j=1}^{M_{p}} \sum_{k=1}^{N_{ij}} \left\| \mathbf{n}_{i}^{T} (\mathbf{p}_{ijk} - \bar{\mathbf{p}}_{i}) \right\|_{2}^{2} \right)$$

$$= \min_{\|\mathbf{n}_{i}\|_{2}=1} \left( \frac{1}{N_{i}} \sum_{j=1}^{M_{p}} \sum_{k=1}^{N_{ij}} \left( \mathbf{n}_{i}^{T} (\mathbf{p}_{ijk} - \bar{\mathbf{p}}_{i}) (\mathbf{p}_{ijk} - \bar{\mathbf{p}}_{i})^{T} \mathbf{n}_{i} \right) \right)$$

$$= \min_{\mathbf{n}_{i}} \mathbf{n}_{i}^{T} \mathbf{A}_{i} \mathbf{n}_{i}, \tag{63}$$

where  $A_i$  is defined in (7) and is a symmetric matrix. Performing Singular Value Decomposition (SVD) of  $A_i$ 

$$\mathbf{A}_i = \mathbf{U}_i \mathbf{\Lambda}_i \mathbf{U}_i^T \tag{64}$$

where

$$\mathbf{U}_i = [\mathbf{u}_1 \quad \mathbf{u}_2 \quad \mathbf{u}_3] \quad \mathbf{\Lambda}_i = \operatorname{diag}(\lambda_1 \quad \lambda_2 \quad \lambda_3) \tag{65}$$

with  $\lambda_1 \geq \lambda_2 \geq \lambda_3$  and  $\mathbf{U}_i^T \mathbf{U}_i = \mathbf{I}$ .

Denote  $\mathbf{m} = \mathbf{U}_i \mathbf{n}_i = \begin{bmatrix} m_1 & m_2 & m_3 \end{bmatrix}^T$ ,  $\|\mathbf{m}\|_2 = \sqrt{\mathbf{n}_i^T \mathbf{U}_i^T \mathbf{U}_i \mathbf{n}_i} = 1$ , then (63) reduces to

$$c_{i} = \min_{\|\mathbf{n}_{i}\|_{2}=1} (\mathbf{n}_{i}^{T} \mathbf{U}_{i} \boldsymbol{\Lambda}_{i} \mathbf{U}_{i}^{T} \mathbf{n}_{i}) = \min_{\|\mathbf{m}\|_{2}=1} (\mathbf{m}^{T} \boldsymbol{\Lambda}_{i} \mathbf{m})$$

$$= \min_{\|\mathbf{m}\|_{2}=1} (\lambda_{1} m_{1}^{2} + \lambda_{2} m_{2}^{2} + \lambda_{3} m_{3}^{2})$$

$$\geq \min_{\|\mathbf{m}\|_{2}=1} (\lambda_{3} m_{1}^{2} + \lambda_{3} m_{2}^{2} + \lambda_{3} m_{3}^{2}) = \lambda_{3},$$
(66)

where the minimum value  $\lambda_3$  is reached when  $m_3 = 1$ , i.e.,  $\mathbf{m}^{\star} = \begin{bmatrix} 0 & 0 & 1 \end{bmatrix}^T$  and  $\mathbf{n}_i^{\star} = \mathbf{U}_i \mathbf{m}^{\star} = \mathbf{u}_3$ .

Therefore, the optimal cost is  $\lambda_3(\mathbf{A}_i)$  and the optimum solution is  $\mathbf{n}^* = \mathbf{u}_3(\mathbf{A}_i)$  and  $\mathbf{q}^* = \bar{\mathbf{p}}_i$ .

2) Edge feature:  $\mathbf{h}_i = \mathbf{I} - \mathbf{n}_i \mathbf{n}_i^T$ , then  $\mathbf{h}_i \mathbf{h}_i^T = \mathbf{h}_i$  and

$$c_{i} = \min_{\mathbf{n}_{i}} \left( \frac{1}{N_{i}} \sum_{j=1}^{M_{p}} \sum_{k=1}^{N_{ij}} \left\| (\mathbf{I} - \mathbf{n}_{i} \mathbf{n}_{i}^{T}) (\mathbf{p}_{ijk} - \bar{\mathbf{p}}_{i}) \right\|_{2}^{2} \right)$$

$$= \min_{\mathbf{n}_{i}} \left( \frac{1}{N_{i}} \sum_{j=1}^{M_{p}} \sum_{k=1}^{N_{ij}} (\mathbf{p}_{ijk} - \bar{\mathbf{p}}_{i})^{T} (\mathbf{I} - \mathbf{n}_{i} \mathbf{n}_{i}^{T}) (\mathbf{p}_{ijk} - \bar{\mathbf{p}}_{i}) \right)$$

$$= \min_{\mathbf{n}_{i}} \left( \frac{1}{N_{i}} \sum_{j=1}^{M_{p}} \sum_{k=1}^{N_{ij}} (\mathbf{p}_{ijk} - \bar{\mathbf{p}}_{i})^{T} (\mathbf{p}_{ijk} - \bar{\mathbf{p}}_{i}) \right)$$

$$- \mathbf{n}_{i}^{T} \left( \frac{1}{N_{i}} \sum_{j=1}^{M_{p}} \sum_{k=1}^{N_{ij}} (\mathbf{p}_{ijk} - \bar{\mathbf{p}}_{i})^{T} (\mathbf{p}_{ijk} - \bar{\mathbf{p}}_{i}) \right) \mathbf{n}_{i} \right)$$

$$= \min_{\mathbf{n}_{i}} (\operatorname{trace}(\mathbf{A}_{i}) - \mathbf{n}_{i}^{T} \mathbf{A}_{i} \mathbf{n}_{i})$$

$$= \lambda_{1} + \lambda_{2} + \lambda_{3} - \max_{\mathbf{n}_{i}} \mathbf{n}_{i}^{T} \mathbf{A}_{i} \mathbf{n}_{i}$$

$$= \lambda_{1} + \lambda_{3}. \tag{67}$$

Therefore, the optimal cost is  $\lambda_2(\mathbf{A}_i) + \lambda_3(\mathbf{A}_i)$  and the optimum solution is  $\mathbf{n}^* = \mathbf{u}_1(\mathbf{A}_i)$  and  $\mathbf{q}^* = \bar{\mathbf{p}}_i$ .

### B. Proof of Theorem 1

For the point collections  $C = \{\mathbf{p}_k \in \mathbb{R}^3 | k = 1, \dots, n\}$ , its point cluster is

$$\Re(\mathcal{C}) = \sum_{k=1}^{n} \begin{bmatrix} \mathbf{p}_k \\ 1 \end{bmatrix} \begin{bmatrix} \mathbf{p}_k^T & 1 \end{bmatrix}$$
 (68)

The rigid transformation of  $\mathcal{C}$  by pose  $\mathbf{T} = \begin{bmatrix} \mathbf{R} & \mathbf{t} \\ \mathbf{0}_{3\times 1} & 1 \end{bmatrix}$  is

$$\mathbf{T} \circ \mathbf{C} = {\mathbf{R}\mathbf{p}_k + \mathbf{t} \in \mathbb{R}^3 | k = 1, \cdots, n}$$
 (69)

whose point cluster is

$$\Re(\mathbf{T} \circ \mathbf{C}) = \sum_{k=1}^{n} \begin{bmatrix} \mathbf{R} \mathbf{p}_{k} + \mathbf{t} \\ 1 \end{bmatrix} [(\mathbf{R} \mathbf{p}_{k} + \mathbf{t})^{T} \quad 1]$$
$$= \sum_{k=1}^{n} \mathbf{T} \begin{bmatrix} \mathbf{p}_{k} \\ 1 \end{bmatrix} [\mathbf{p}_{k}^{T} \quad 1] \mathbf{T}^{T} = \mathbf{T} \Re(\mathbf{C}) \mathbf{T}^{T} \quad (70)$$

which yields the solution.  $\square$ 

## C. Proof of Theorem 2

For two point collections  $\mathcal{C}_1 = \{\mathbf{p}_k^1 \in \mathbb{R}^3 | k=1,\cdots,n_1\}$  and  $\mathcal{C}_2 = \{\mathbf{p}_k^2 \in \mathbb{R}^3 | k=1,\cdots,n_2\}$ , their point clusters are

$$\Re(\mathcal{C}_i) = \sum_{k=1}^{n_l} \begin{bmatrix} \mathbf{p}_k^l \\ 1 \end{bmatrix} \begin{bmatrix} (\mathbf{p}_k^l)^T & 1 \end{bmatrix} \quad l = 1, 2$$
 (71)

The merge of  $C_1$  and  $C_2$  is

$$C_1 \oplus C_2 = \{ \mathbf{p}_k^l \in \mathbb{R}^3 | l = 1, 2; k = 1, \cdots, n_l \}$$
 (72)

whose point cluster is

$$\Re(\mathcal{C}_1 \oplus \mathcal{C}_2) = \sum_{k=1}^{n_1} \begin{bmatrix} \mathbf{p}_k^1 \\ 1 \end{bmatrix} \begin{bmatrix} (\mathbf{p}_k^1)^T & 1 \end{bmatrix} + \sum_{k=1}^{n_2} \begin{bmatrix} \mathbf{p}_k^2 \\ 1 \end{bmatrix} \begin{bmatrix} (\mathbf{p}_k^2)^T & 1 \end{bmatrix}$$
$$= \Re(\mathcal{C}_1) + \Re(\mathcal{C}_2)$$
(73)

which yields the solution.  $\square$ 

D. Proof of Theorem 3

Let 
$$\mathbf{T}_0 = \begin{bmatrix} \mathbf{R}_0 & \mathbf{t}_0 \\ 0 & 1 \end{bmatrix}$$
 and  $\bar{\mathbf{C}} = \mathbf{T}_0 \mathbf{C} \mathbf{T}_0^T = \begin{bmatrix} \bar{\mathbf{P}} & \bar{\mathbf{v}} \\ \bar{\mathbf{v}}^T & N \end{bmatrix}$ , then

$$\bar{\mathbf{P}} = \mathbf{R}_0 \mathbf{P}_0 \mathbf{R}_0^T + \mathbf{R}_0 \mathbf{v}_0 \mathbf{t}_0^T + \mathbf{t}_0 \mathbf{v}_0^T \mathbf{R}_0^T + N \mathbf{t}_0 \mathbf{t}_0^T, \tag{74}$$

$$\bar{\mathbf{v}} = \mathbf{R}_0 \mathbf{v}_0 + N \mathbf{t}_0, \tag{75}$$

$$\mathbf{A}\left(\mathbf{T}_{0}\mathbf{C}\mathbf{T}_{0}^{T}\right) = \frac{1}{N}\bar{\mathbf{P}} - \frac{1}{N^{2}}\bar{\mathbf{v}}\bar{\mathbf{v}}^{T} = \mathbf{R}_{0}\mathbf{A}(\mathbf{C})\mathbf{R}_{0}^{T}.$$
 (76)

Since  $\mathbf{A}\left(\mathbf{T}_0\mathbf{C}\mathbf{T}_0^T\right)$  and  $\mathbf{A}(\mathbf{C})$  are similar by transformation  $\mathbf{R}_0$ , they have the same eigenvalue.  $\square$ 

## E. Proof of Theorem 4

Denote  $\lambda_l$  the l-th largest eigenvalue of  $\mathbf{A}$  and  $\mathbf{u}_l$  the corresponding vector, i.e.,  $\lambda_l \mathbf{u}_l = \mathbf{A} \mathbf{u}_l$ . Since  $\mathbf{A}$  is symmetric,  $\mathbf{u}_l$  is an orthonormal vector. Multiplying both sides of  $\lambda_l \mathbf{u}_l = \mathbf{A} \mathbf{u}_l$  by  $\mathbf{u}_l^T$  leads to

$$\lambda_l = \mathbf{u}_l^T \mathbf{A} \mathbf{u}_l. \tag{77}$$

Note that in the above equation,  $\lambda_l$ ,  $\mathbf{u}_l$  and  $\mathbf{A}_l$  all depend on the pose  $\mathbf{T}$ . To avoid any confusion, we write them as explicit functions of  $\mathbf{T}$ :

$$\lambda_l(\mathbf{T}) = \mathbf{u}_l^T(\mathbf{T})\mathbf{A}(\mathbf{T})\mathbf{u}_l(\mathbf{T}). \tag{78}$$

Parameterizing the pose  ${f T}$  by  $\delta {f T}$  leads to

$$\lambda_l(\delta \mathbf{T}) = \mathbf{u}_l^T(\delta \mathbf{T}) \mathbf{A}(\delta \mathbf{T}) \mathbf{u}_l(\delta \mathbf{T}). \tag{79}$$

From the first conclusion in Lemma 1, we know that for a vector  $\mathbf{x} = \begin{bmatrix} x_1 & \cdots & x_m \end{bmatrix} \in \mathbb{R}^m$  that the matrix  $\mathbf{A}$  depends on, we have

$$\frac{\partial \lambda_l(\mathbf{x})}{\partial x_i} = \frac{\partial \left(\mathbf{u}_l^T(\mathbf{x})\mathbf{A}(\mathbf{x})\mathbf{u}_l(\mathbf{x})\right)}{\partial x_i} = \mathbf{u}_l^T(\mathbf{x})\frac{\partial \mathbf{A}(\mathbf{x})}{\partial x_i}\mathbf{u}_l(\mathbf{x}),$$

$$\forall i = 1, \dots, m, x_i \in \mathbb{R} \quad (80)$$

To avoid the use of a tensor when applying this derivative to the complete parameter vector  $\mathbf{x}$ , we fix the vector  $\mathbf{u}_l(\mathbf{x})$  at its current value and lump it with the matrix  $\mathbf{A}(\mathbf{x})$  within the derivative, i.e.,

$$\mathbf{u}_{l}^{T}(\mathbf{x})\frac{\partial \mathbf{A}(\mathbf{x})}{\partial x_{i}}\mathbf{u}_{l}(\mathbf{x}) = \frac{\partial \mathbf{u}_{l}^{T}\mathbf{A}(\mathbf{x})\mathbf{u}_{l}}{\partial x_{i}}$$
(81)

where on the right hand side,  $\mathbf{u}_l$  is fixed (so we remove its argument  $\mathbf{x}$ ) and the derivative is only applied on the component  $\mathbf{A}(\mathbf{x})$  (so we keep its argument  $\mathbf{x}$ ).

Now, the input parameter is the poses parameterized by  $\delta \mathbf{T}$ , setting  $\mathbf{x}$  to  $\delta \mathbf{T}$ ) in (81) leads to

$$\frac{\partial \lambda_l(\delta \mathbf{T})}{\partial \delta \mathbf{T}} = \frac{\partial \mathbf{u}_l^T \mathbf{A}(\delta \mathbf{T}) \mathbf{u}_l}{\partial \delta \mathbf{T}}.$$
 (82)

Recalling the results from Lemma 2 with k = l, we obtain:

$$\mathbf{u}_{l}^{T}\mathbf{A}(\delta\mathbf{T})\mathbf{u}_{l} = \frac{1}{2}\delta\mathbf{T}^{T} \cdot \mathbf{H}_{ll} \cdot \delta\mathbf{T} + \mathbf{g}_{ll} \cdot \delta\mathbf{T} + r_{ll}.$$
 (83)

Therefore, the first order derivative of  $\lambda_l(\mathbf{T})$  w.r.t.  $\mathbf{T}$  is

$$\mathbf{J} \triangleq \frac{\partial \lambda_l(\delta \mathbf{T})}{\partial \delta \mathbf{T}} = \frac{\partial \mathbf{u}_l^T \mathbf{A}(\delta \mathbf{T}) \mathbf{u}_l}{\partial \delta \mathbf{T}} = \mathbf{g}_{ll}.$$
 (84)

Now, we derive the second order derivative. From (80), we have,

$$\frac{\partial \lambda_l(\mathbf{x})}{\partial x_i} = \mathbf{u}_l^T(\mathbf{x}) \frac{\partial \mathbf{A}(\mathbf{x})}{\partial x_i} \mathbf{u}_l(\mathbf{x}), \forall x_i \in \mathbb{R},$$
(85)

Differentiating it w.r.t. the second parameter  $x_j \in \mathbb{R}$  leads to

$$\frac{\partial^{2} \lambda_{l}(\mathbf{x})}{\partial x_{j} \partial x_{i}} = \frac{\partial}{\partial x_{j}} \left( \mathbf{u}_{l}^{T}(\mathbf{x}) \frac{\partial \mathbf{A}(\mathbf{x})}{\partial x_{i}} \mathbf{u}_{l}(\mathbf{x}) \right) 
= \left( \frac{\partial \mathbf{u}_{l}(\mathbf{x})}{\partial x_{j}} \right)^{T} \left( \frac{\partial \mathbf{A}(\mathbf{x}) \mathbf{u}_{l}}{\partial x_{i}} \right) + \frac{\partial}{\partial x_{j}} \left( \frac{\partial \mathbf{u}_{l}^{T} \mathbf{A}(\mathbf{x}) \mathbf{u}_{l}}{\partial x_{i}} \right) 
+ \left( \frac{\partial \mathbf{A}(\mathbf{x}) \mathbf{u}_{l}}{\partial x_{i}} \right)^{T} \left( \frac{\partial \mathbf{u}_{l}(\mathbf{x})}{\partial x_{j}} \right)$$
(86)

Applying the above results to each elements  $x_i, x_j$  leads to

$$\frac{\partial^{2} \lambda_{l}(\mathbf{x})}{\partial \mathbf{x}^{2}} = \left(\frac{\partial \mathbf{u}_{l}(\mathbf{x})}{\partial \mathbf{x}}\right)^{T} \left(\frac{\partial \mathbf{A}(\mathbf{x}) \mathbf{u}_{l}}{\partial \mathbf{x}}\right) + \frac{\partial}{\partial \mathbf{x}} \left(\frac{\partial \mathbf{u}_{l}^{T} \mathbf{A}(\mathbf{x}) \mathbf{u}_{l}}{\partial \mathbf{x}}\right) + \left(\frac{\partial \mathbf{A}(\mathbf{x}) \mathbf{u}_{l}}{\partial \mathbf{x}}\right)^{T} \left(\frac{\partial \mathbf{u}_{l}(\mathbf{x})}{\partial \mathbf{x}}\right).$$
(87)

To compute  $\frac{\partial \mathbf{u}_l(\mathbf{x})}{\partial \mathbf{x}}$ , we apply the second conclusion in Lemma 1 to all components of  $\mathbf{x}$  and use the notation trick similar to (81):

$$\frac{\partial \mathbf{u}_{l}(\mathbf{x})}{\partial \mathbf{x}} = \sum_{k=1, k \neq l}^{3} \frac{1}{\lambda_{l} - \lambda_{k}} \mathbf{u}_{k} \mathbf{u}_{k}^{T} \frac{\partial \mathbf{A}(\mathbf{x}) \mathbf{u}_{l}}{\partial \mathbf{x}}$$
(88)

Now, the input parameter is the pose vector parameterized by  $\delta \mathbf{T}$ , substituting  $\mathbf{x} = \delta \mathbf{T}$  into (87) leads to

$$\frac{\partial^{2} \lambda_{l}(\delta \mathbf{T})}{\partial \delta \mathbf{T}^{2}} = \underbrace{\left(\frac{\partial \mathbf{u}_{l}(\delta \mathbf{T})}{\partial \delta \mathbf{T}}\right)^{T} \left(\frac{\partial \mathbf{A}(\delta \mathbf{T}) \mathbf{u}_{l}}{\partial \delta \mathbf{T}}\right)}_{\mathbf{H}_{l}} + \underbrace{\frac{\partial^{2} \mathbf{u}_{l}^{T} \mathbf{A}(\delta \mathbf{T}) \mathbf{u}_{l}}{\partial \delta \mathbf{T}^{2}}}_{\mathbf{H}_{ll}} + \underbrace{\left(\frac{\partial \mathbf{A}(\delta \mathbf{T}) \mathbf{u}_{l}}{\partial \delta \mathbf{T}}\right)^{T} \left(\frac{\partial \mathbf{u}_{l}(\delta \mathbf{T})}{\partial \delta \mathbf{T}}\right)}_{\mathbf{H}^{T}}, \quad (89)$$

where term  $\mathbf{H}_{ll}$  is from (83). To obtain the term  $\mathbf{H}_{l}$ , we substitute  $\mathbf{x} = \delta \mathbf{T}$  into (88):

$$\frac{\partial \mathbf{u}_{l}(\delta \mathbf{T})}{\partial \delta \mathbf{T}} = \sum_{k=1, k \neq l}^{3} \frac{1}{\lambda_{l} - \lambda_{k}} \mathbf{u}_{k} \mathbf{u}_{k}^{T} \frac{\partial \mathbf{A}(\delta \mathbf{T}) \mathbf{u}_{l}}{\partial \delta \mathbf{T}} \qquad (90)$$

$$= \sum_{k=1, k \neq l}^{3} \frac{1}{\lambda_{l} - \lambda_{k}} \mathbf{u}_{k} \frac{\partial \mathbf{u}_{k}^{T} \mathbf{A}(\delta \mathbf{T}) \mathbf{u}_{l}}{\partial \delta \mathbf{T}}, \qquad (91)$$

$$=\sum_{k=1,k\neq l}^{3}\frac{1}{\lambda_{l}-\lambda_{k}}\mathbf{u}_{k}\mathbf{g}_{kl}.$$
(92)

Then,

$$\mathbf{H}_{l} = \left(\frac{\partial \mathbf{A}(\delta \mathbf{T}) \mathbf{u}_{l}}{\partial \delta \mathbf{T}}\right)^{T} \left(\frac{\partial \mathbf{u}_{l}(\delta \mathbf{T})}{\partial \delta \mathbf{T}}\right) \tag{93}$$

$$= \left(\frac{\partial \mathbf{A}(\delta \mathbf{T})\mathbf{u}_l}{\partial \delta \mathbf{T}}\right)^T \sum_{k=1, k \neq l}^3 \frac{1}{\lambda_l - \lambda_k} \mathbf{u}_k \mathbf{g}_{kl}$$
(94)

$$= \sum_{k=1,k\neq l}^{3} \left( \frac{\partial \mathbf{u}_{k}^{T} \mathbf{A}(\delta \mathbf{T}) \mathbf{u}_{l}}{\partial \delta \mathbf{T}} \right)^{T} \frac{1}{\lambda_{l} - \lambda_{k}} \mathbf{g}_{kl}$$
(95)

$$= \sum_{k=1, k \neq l}^{3} \frac{1}{\lambda_l - \lambda_k} \mathbf{g}_{kl}^T \mathbf{g}_{kl}. \tag{96}$$

Therefore, the second order derivative of  $\lambda_l(\mathbf{T})$  w.r.t.  $\mathbf{T}$  is

$$\mathbf{H} \triangleq \frac{\partial^2 \lambda_l(\delta \mathbf{T})}{\partial \delta \mathbf{T}^2} = \mathbf{H}_l + \mathbf{H}_{ll} + \mathbf{H}_l^T$$

$$= \mathbf{H}_{ll} + \sum_{k=1}^{3} \frac{2}{\lambda_l - \lambda_k} \mathbf{g}_{kl}^T \mathbf{g}_{kl}.$$
(97)

Next, we show that

$$\mathbf{J}\delta\mathbf{T} = 0, \delta\mathbf{T}^T\mathbf{H}\delta\mathbf{T} = 0, \delta\mathbf{T} = \begin{bmatrix} \mathbf{w} \\ \vdots \\ \mathbf{w} \end{bmatrix}, \forall \mathbf{w} \in \mathbb{R}^6$$
 (98)

From (84), we can obtain

$$\mathbf{J}\delta\mathbf{T} = \mathbf{g}_{ll}\delta\mathbf{T} = \sum_{\mathbf{q}=1}^{M_p} \mathbf{g}_{ll}^{\mathbf{q}}\mathbf{w}$$
 (99)

where, from (14), we know

$$\mathbf{g}_{ll}^{q} = \frac{2}{N} \mathbf{u}_{l}^{T} \mathbf{S}_{\mathbf{P}} (\mathbf{T}_{q} - \frac{1}{N} \mathbf{C} \mathbf{F}) \mathbf{C}_{q} \mathbf{T}_{q}^{T} \mathbf{U}_{l}^{T}$$
(100)

$$\mathbf{U}_{l} = \begin{bmatrix} -\lfloor \mathbf{u}_{l} \rfloor & \mathbf{0}_{3\times 1} \\ \mathbf{0}_{3\times 3} & \mathbf{u}_{l} \end{bmatrix} \quad \mathbf{F} = \begin{bmatrix} \mathbf{0}_{3\times 3} & \mathbf{0}_{3\times 1} \\ \mathbf{0}_{1\times 3} & 1 \end{bmatrix}$$
(101)

$$\mathbf{S}_{\mathbf{P}} = \begin{bmatrix} \mathbf{I}_{3\times3} & \mathbf{0}_{3\times1} \end{bmatrix} \quad \mathbf{C} = \sum_{j=1}^{M_p} \mathbf{T}_j \mathbf{C}_j \mathbf{T}_j^T$$
 (102)

Thus,

$$\begin{split} &\sum_{\mathbf{q}=1}^{M_p} \mathbf{g}_{ll}^{\mathbf{q}} \mathbf{w} = \frac{2}{N} \sum_{\mathbf{q}=1}^{M_p} \mathbf{u}_l^T \mathbf{S}_{\mathbf{P}} (\mathbf{T}_{\mathbf{q}} - \frac{1}{N} \mathbf{C} \mathbf{F}) \mathbf{C}_{\mathbf{q}} \mathbf{T}_{\mathbf{q}}^T \mathbf{U}_l^T \mathbf{w} \\ &= \frac{2}{N} \mathbf{u}_l^T \mathbf{S}_{\mathbf{P}} \left( \sum_{\mathbf{q}=1}^{M_p} (\mathbf{T}_{\mathbf{q}} \mathbf{C}_{\mathbf{q}} \mathbf{T}_{\mathbf{q}}^T - \frac{1}{N} \mathbf{C} \mathbf{F} \mathbf{C}_{\mathbf{q}} \mathbf{T}_{\mathbf{q}}^T) \right) \mathbf{U}_l^T \mathbf{w}. \end{split}$$

Since  $\sum_{q=1}^{M_p} \mathbf{T}_q \mathbf{C}_q \mathbf{T}_q^T = \mathbf{C}$  and  $\sum_{q=1}^{M_p} \mathbf{F} \mathbf{C}_q \mathbf{T}_q^T = \mathbf{F} \mathbf{C}$  from equation (48), we have

$$\sum_{n=1}^{M_p} \mathbf{g}_{ll}^{\mathbf{q}} \mathbf{w} = \frac{2}{N} \mathbf{u}_l^T \mathbf{S}_{\mathbf{P}} (\mathbf{C} - \frac{1}{N} \mathbf{C} \mathbf{F} \mathbf{C}) \mathbf{U}_l^T \mathbf{w}.$$

Recalling  $\mathbf{A} = \frac{1}{N} \mathbf{P} - \frac{1}{N^2} \mathbf{v} \mathbf{v}^T$ ,

$$\mathbf{C} - \frac{1}{N}\mathbf{CFC}$$

$$= \begin{bmatrix} \mathbf{P} & \mathbf{v} \\ \mathbf{v}^{T} & N \end{bmatrix} - \frac{1}{N} \begin{bmatrix} \mathbf{P} & \mathbf{v} \\ \mathbf{v}^{T} & N \end{bmatrix} \begin{bmatrix} \mathbf{0}_{3\times3} & \mathbf{0}_{3\times1} \\ \mathbf{0}_{1\times3} & 1 \end{bmatrix} \begin{bmatrix} \mathbf{P} & \mathbf{v} \\ \mathbf{v}^{T} & N \end{bmatrix}$$

$$= \begin{bmatrix} \mathbf{P} & \mathbf{v} \\ \mathbf{v}^{T} & N \end{bmatrix} - \begin{bmatrix} \frac{1}{N}\mathbf{v}\mathbf{v}^{T} & \mathbf{v} \\ \mathbf{v}^{T} & N \end{bmatrix} = \begin{bmatrix} N\mathbf{A} & \mathbf{0}_{3\times1} \\ \mathbf{0}_{1\times3} & 0 \end{bmatrix}$$
(103)

Thus,

$$\sum_{q=1}^{M_p} \mathbf{g}_{ll}^{\mathbf{q}} \mathbf{w} = \frac{2}{N} \mathbf{u}_l^T \mathbf{S}_{\mathbf{P}} \begin{bmatrix} N \mathbf{A} & \mathbf{0}_{3 \times 1} \\ \mathbf{0}_{1 \times 3} & 0 \end{bmatrix} \mathbf{U}_l^T \mathbf{w}$$
 (104)

$$= 2 \begin{bmatrix} \mathbf{u}_l^T \mathbf{A} & \mathbf{0}_{3\times 1} \end{bmatrix} \begin{bmatrix} -\lfloor \mathbf{u}_l \rfloor & \mathbf{0}_{3\times 1} \\ \mathbf{0}_{3\times 3} & \mathbf{u}_l \end{bmatrix}^T \mathbf{w}$$
 (105)

$$= 2 \begin{bmatrix} \mathbf{u}_l^T \mathbf{A} \lfloor \mathbf{u}_l \rfloor & \mathbf{0}_{3 \times 1} \end{bmatrix} \mathbf{w}$$
 (106)

Since  $\mathbf{A}\mathbf{u}_l = \lambda_l \mathbf{u}_l$ ,

$$\mathbf{u}_l^T \mathbf{A} \lfloor \mathbf{u}_l \rfloor = \lambda_l \mathbf{u}_l^T \lfloor \mathbf{u}_l \rfloor = \mathbf{0}_{1 \times 3}. \tag{107}$$

Therefore,

$$\mathbf{J}\delta\mathbf{T} = \sum_{\mathbf{q}=1}^{M_p} \mathbf{g}_{ll}^{\mathbf{q}} \mathbf{w} = 0 \tag{108}$$

For the proof of  $\delta \mathbf{T}^T \mathbf{H} \delta \mathbf{T} = 0$ , from (97)

$$\delta \mathbf{T}^{T} \mathbf{H} \delta \mathbf{T} = \delta \mathbf{T}^{T} (\mathbf{H}_{ll} + \sum_{k=1, k \neq l}^{3} \frac{2}{\lambda_{l} - \lambda_{k}} \mathbf{g}_{kl}^{T} \mathbf{g}_{kl}) \delta \mathbf{T}$$

$$= \mathbf{w}^{T} \sum_{p=1}^{M_{p}} \sum_{q=1}^{M_{p}} \left( \mathbf{H}_{ll}^{p,q} + \sum_{k=1, k \neq l}^{3} \frac{2}{\lambda_{l} - \lambda_{k}} (\mathbf{g}_{kl}^{p})^{T} \mathbf{g}_{kl}^{q} \right) \mathbf{w}$$
(109)

where

$$\mathbf{H}_{ll}^{p,q} = -\frac{2}{N^{2}} \mathbf{U}_{l} \mathbf{T}_{p} \mathbf{D}_{p,q} \mathbf{T}_{q}^{T} \mathbf{U}_{l}^{T} + \mathbb{1}_{p=q} \left( \frac{2}{N} \mathbf{U}_{l} \mathbf{T}_{q} \mathbf{C}_{q} \mathbf{T}_{q}^{T} \mathbf{U}_{l}^{T} + \left[ \mathbf{K}_{ll}^{q} \quad \mathbf{0}_{3 \times 3} \right] \right)$$
(110)
$$\mathbf{K}_{ll}^{q} = \frac{1}{N} \lfloor \mathbf{S}_{\mathbf{P}} \mathbf{T}_{q} \mathbf{C}_{q} (\mathbf{T}_{q} - \frac{1}{N} \mathbf{C} \mathbf{F})^{T} \mathbf{S}_{\mathbf{P}}^{T} \mathbf{u}_{l} \rfloor \lfloor \mathbf{u}_{l} \rfloor$$

$$+ \frac{1}{N} \lfloor \mathbf{u}_{l} \rfloor \lfloor \mathbf{S}_{\mathbf{P}} \mathbf{T}_{q} \mathbf{C}_{q} (\mathbf{T}_{q} - \frac{1}{N} \mathbf{C} \mathbf{F})^{T} \mathbf{S}_{\mathbf{P}}^{T} \mathbf{u}_{l} \rfloor,$$
(111)
$$\mathbf{g}_{kl}^{q} = \frac{1}{N} \mathbf{u}_{l}^{T} \mathbf{S}_{\mathbf{P}} (\mathbf{T}_{q} - \frac{1}{N} \mathbf{C} \mathbf{F}) \mathbf{C}_{q} \mathbf{T}_{q}^{T} \mathbf{U}_{k}^{T}$$

$$+ \frac{1}{N} \mathbf{u}_{k}^{T} \mathbf{S}_{\mathbf{P}} (\mathbf{T}_{q} - \frac{1}{N} \mathbf{C} \mathbf{F}) \mathbf{C}_{q} \mathbf{T}_{q}^{T} \mathbf{U}_{l}^{T}$$
(112)

We will divide (109) into two parts to discuss. For the first part,

$$\sum_{p=1}^{M_p} \sum_{q=1}^{M_p} \mathbf{H}_{ll}^{p,q} = -\frac{2}{N^2} \sum_{p=1}^{M_p} \sum_{q=1}^{M_p} \mathbf{U}_l \mathbf{T}_p \mathbf{D}_{p,q} \mathbf{T}_q^T \mathbf{U}_l^T + \frac{2}{N} \sum_{q=1}^{M_p} \mathbf{U}_l \mathbf{T}_q \mathbf{C}_q \mathbf{T}_q^T \mathbf{U}_l^T + \begin{bmatrix} \sum_{q=1}^{M_p} \mathbf{K}_{ll}^q & \mathbf{0}_{3\times 3} \\ \mathbf{0}_{3\times 3} & \mathbf{0}_{3\times 3} \end{bmatrix}$$
(113)

Since  $\sum_{q=1}^{M_p} \mathbf{T}_q \mathbf{C}_q \mathbf{T}_q^T = \mathbf{C}$ ,  $\sum_{q=1}^{M_p} \mathbf{F} \mathbf{C}_q \mathbf{T}_q^T = \mathbf{F} \mathbf{C}$  and  $\sum_{q=1}^{M_p} \mathbf{T}_q \mathbf{C}_q \mathbf{F} = \mathbf{C} \mathbf{F}$  from (48), we have

$$\sum_{p=1}^{M_p} \sum_{q=1}^{M_p} \mathbf{T}_p \mathbf{D}_{p,q} \mathbf{T}_q^T = \sum_{p=1}^{M_p} \sum_{q=1}^{M_p} \mathbf{T}_p \mathbf{C}_p \mathbf{F} \mathbf{C}_q \mathbf{T}_q^T$$

$$= \sum_{p=1}^{M_p} \mathbf{T}_p \mathbf{C}_p \sum_{q=1}^{M_p} \mathbf{F} \mathbf{C}_q \mathbf{T}_q^T = \sum_{p=1}^{M_p} \mathbf{T}_p \mathbf{C}_p \mathbf{F} \mathbf{C} = \mathbf{CFC}, \quad (114)$$

and

$$\sum_{q=1}^{M_p} \mathbf{K}_{ll}^{q} = \frac{1}{N} \sum_{q=1}^{M_p} [\mathbf{S}_{\mathbf{P}} \mathbf{T}_{\mathbf{q}} \mathbf{C}_{\mathbf{q}} (\mathbf{T}_{\mathbf{q}} - \frac{1}{N} \mathbf{C} \mathbf{F})^T \mathbf{S}_{\mathbf{P}}^T \mathbf{u}_{l}] [\mathbf{u}_{l}] 
+ \frac{1}{N} \sum_{q=1}^{M_p} [\mathbf{u}_{l}] [\mathbf{S}_{\mathbf{P}} \mathbf{T}_{\mathbf{q}} \mathbf{C}_{\mathbf{q}} (\mathbf{T}_{\mathbf{q}} - \frac{1}{N} \mathbf{C} \mathbf{F})^T \mathbf{S}_{\mathbf{P}}^T \mathbf{u}_{l}] 
= \frac{1}{N} [\mathbf{S}_{\mathbf{P}} (\mathbf{C} - \frac{1}{N} \mathbf{C} \mathbf{F} \mathbf{C}) \mathbf{S}_{\mathbf{P}}^T \mathbf{u}_{l}] [\mathbf{u}_{l}] 
+ \frac{1}{N} [\mathbf{u}_{l}] [\mathbf{S}_{\mathbf{P}} (\mathbf{C} - \frac{1}{N} \mathbf{C} \mathbf{F} \mathbf{C}) \mathbf{S}_{\mathbf{P}}^T \mathbf{u}_{l}].$$
(115)

Then, from (103) and  $\mathbf{A}\mathbf{u}_l = \lambda_l \mathbf{u}_l$ ,

$$\sum_{q=1}^{M_p} \mathbf{K}_{ll}^{\mathbf{q}} = \lfloor \mathbf{A} \mathbf{u}_l \rfloor \lfloor \mathbf{u}_l \rfloor + \lfloor \mathbf{u}_l \rfloor \lfloor \mathbf{A} \mathbf{u}_l \rfloor = 2\lambda_l \lfloor \mathbf{u}_l \rfloor^2.$$
 (116)

Now, substituting the results in (114) and (116) into (113):

$$\sum_{p=1}^{M_p} \sum_{q=1}^{M_p} \mathbf{H}_{ll}^{p,q} = -\frac{2}{N^2} \mathbf{U}_l \mathbf{C} \mathbf{F} \mathbf{C} \mathbf{U}_l^T + \frac{2}{N} \mathbf{U}_l \mathbf{C} \mathbf{U}_l^T + \begin{bmatrix} 2\lambda_l |\mathbf{u}_l|^2 & \mathbf{0} \\ \mathbf{0} & \mathbf{0} \end{bmatrix} = 2 \mathbf{U}_l \begin{bmatrix} \mathbf{A} & \mathbf{0} \\ \mathbf{0} & 0 \end{bmatrix} \mathbf{U}_l^T + \begin{bmatrix} 2\lambda_l |\mathbf{u}_l|^2 & \mathbf{0} \\ \mathbf{0} & \mathbf{0} \end{bmatrix}$$

$$= 2 \begin{bmatrix} \lambda_l |\mathbf{u}_l|^2 - |\mathbf{u}_l| \mathbf{A} |\mathbf{u}_l| & \mathbf{0} \\ \mathbf{0} & \mathbf{0} \end{bmatrix}.$$
(117)

For the second part in (109),

$$\sum_{p=1}^{M_p} \sum_{q=1}^{M_p} \left( \sum_{k=1, k \neq l}^{3} \frac{2}{\lambda_l - \lambda_k} (\mathbf{g}_{kl}^p)^T \mathbf{g}_{kl}^q \right)$$

$$= \sum_{k=1, k \neq l}^{3} \frac{2}{\lambda_l - \lambda_k} \left( \sum_{p=1}^{M_p} \mathbf{g}_{kl}^p \right)^T \left( \sum_{q=1}^{M_p} \mathbf{g}_{kl}^q \right)$$
(118)

where

$$\sum_{q=1}^{M_p} \mathbf{g}_{kl}^q = \frac{1}{N} \mathbf{u}_l^T \mathbf{S}_{\mathbf{P}} \sum_{q=1}^{M_p} (\mathbf{T}_{\mathbf{q}} \mathbf{C}_{\mathbf{q}} \mathbf{T}_{\mathbf{q}}^T - \frac{1}{N} \mathbf{C} \mathbf{F} \mathbf{C}_{\mathbf{q}} \mathbf{T}_{\mathbf{q}}^T) \mathbf{U}_k^T$$

$$+ \frac{1}{N} \mathbf{u}_k^T \mathbf{S}_{\mathbf{P}} \sum_{q=1}^{M_p} (\mathbf{T}_{\mathbf{q}} \mathbf{C}_{\mathbf{q}} \mathbf{T}_{\mathbf{q}}^T - \frac{1}{N} \mathbf{C} \mathbf{F} \mathbf{C}_{\mathbf{q}} \mathbf{T}_{\mathbf{q}}^T) \mathbf{U}_l^T$$

$$= \frac{1}{N} \mathbf{u}_l^T \mathbf{S}_{\mathbf{P}} (\mathbf{C} - \frac{1}{N} \mathbf{C} \mathbf{F} \mathbf{C}) \mathbf{U}_k^T$$

$$+ \frac{1}{N} \mathbf{u}_k^T \mathbf{S}_{\mathbf{P}} (\mathbf{C} - \frac{1}{N} \mathbf{C} \mathbf{F} \mathbf{C}) \mathbf{U}_l^T$$

$$= \mathbf{u}_l^T [\mathbf{A} \quad \mathbf{0}_{3\times 1}] \mathbf{U}_k^T + \mathbf{u}_k^T [\mathbf{A} \quad \mathbf{0}_{3\times 1}] \mathbf{U}_l^T$$

$$= [\mathbf{u}_l^T \mathbf{A} \lfloor \mathbf{u}_k \rfloor \quad \mathbf{0}_{3\times 1}] + [\mathbf{u}_k^T \mathbf{A} \lfloor \mathbf{u}_l \rfloor \quad \mathbf{0}_{3\times 1}]$$

$$= [\lambda_l \mathbf{u}_l^T \lfloor \mathbf{u}_k \rfloor + \lambda_k \mathbf{u}_k^T \lfloor \mathbf{u}_l \rfloor \quad \mathbf{0}_{3\times 1}]$$

$$(119)$$

Therefore.

$$\sum_{k=1,k\neq l}^{3} \frac{2}{\lambda_{l} - \lambda_{k}} \left( \sum_{p=1}^{M_{p}} \mathbf{g}_{kl}^{p} \right)^{T} \left( \sum_{q=1}^{M_{p}} \mathbf{g}_{kl}^{q} \right)$$

$$= \sum_{k=1,k\neq l}^{3} \frac{2}{\lambda_{l} - \lambda_{k}} \begin{bmatrix} \mathbf{r}_{kl} & \mathbf{0}_{3\times 1} \\ \mathbf{0}_{1\times 3} & 0 \end{bmatrix}$$
(120)

where due to  $[\mathbf{u}_k]\mathbf{u}_l = -[\mathbf{u}_l]\mathbf{u}_k$  and  $\mathbf{u}_k^T[\mathbf{u}_l] = -\mathbf{u}_l^T[\mathbf{u}_k]$ 

$$\mathbf{r}_{kl} = (\lambda_{l}\mathbf{u}_{l}^{T} \lfloor \mathbf{u}_{k} \rfloor + \lambda_{k}\mathbf{u}_{k}^{T} \lfloor \mathbf{u}_{l} \rfloor))^{T} (\lambda_{l}\mathbf{u}_{l}^{T} \lfloor \mathbf{u}_{k} \rfloor + \lambda_{k}\mathbf{u}_{k}^{T} \lfloor \mathbf{u}_{l} \rfloor))$$

$$= -\lambda_{l}^{2} \lfloor \mathbf{u}_{k} \rfloor \mathbf{u}_{l}\mathbf{u}_{l}^{T} \lfloor \mathbf{u}_{k} \rfloor - \lambda_{l}\lambda_{k} \lfloor \mathbf{u}_{k} \rfloor \mathbf{u}_{l}\mathbf{u}_{k}^{T} \lfloor \mathbf{u}_{l} \rfloor$$

$$-\lambda_{k}^{2} \lfloor \mathbf{u}_{l} \rfloor \mathbf{u}_{k}\mathbf{u}_{k}^{T} \lfloor \mathbf{u}_{l} \rfloor - \lambda_{l}\lambda_{k} \lfloor \mathbf{u}_{l} \rfloor \mathbf{u}_{k}\mathbf{u}_{l}^{T} \lfloor \mathbf{u}_{k} \rfloor$$

$$= -(\lambda_{l} - \lambda_{k})^{2} \lfloor \mathbf{u}_{l} \rfloor \mathbf{u}_{k}\mathbf{u}_{k}^{T} \lfloor \mathbf{u}_{l} \rfloor. \tag{121}$$

Thus,

$$\sum_{k=1,k\neq l}^{3} \frac{2}{\lambda_{l} - \lambda_{k}} \left( \sum_{p=1}^{M_{p}} \mathbf{g}_{kl}^{p} \right)^{T} \left( \sum_{q=1}^{M_{p}} \mathbf{g}_{kl}^{q} \right)$$

$$= 2 \sum_{k=1,k\neq l}^{3} \begin{bmatrix} (\lambda_{k} - \lambda_{l}) \lfloor \mathbf{u}_{l} \rfloor \mathbf{u}_{k} \mathbf{u}_{k}^{T} \lfloor \mathbf{u}_{l} \rfloor & \mathbf{0} \\ \mathbf{0} & 0 \end{bmatrix}$$
(122)

Now from (117) and (122), the equation (109) is turned into

$$\delta \mathbf{T}^T \mathbf{H} \delta \mathbf{T} = \mathbf{w}^T \begin{bmatrix} 2\mathbf{L}_l & \mathbf{0}_{3\times 1} \\ \mathbf{0}_{1\times 3} & 0 \end{bmatrix} \mathbf{w}, \tag{123}$$

where

$$\mathbf{L}_{l} = \lambda_{l} \lfloor \mathbf{u}_{l} \rfloor^{2} - \lfloor \mathbf{u}_{l} \rfloor \mathbf{A} \lfloor \mathbf{u}_{l} \rfloor + \sum_{k=1, k \neq l}^{3} (\lambda_{k} - \lambda_{l}) \lfloor \mathbf{u}_{l} \rfloor \mathbf{u}_{k} \mathbf{u}_{k}^{T} \lfloor \mathbf{u}_{l} \rfloor$$

$$= \lambda_{l} \lfloor \mathbf{u}_{l} \rfloor^{2} - \lfloor \mathbf{u}_{l} \rfloor \mathbf{A} \lfloor \mathbf{u}_{l} \rfloor$$

$$+ \lfloor \mathbf{u}_{l} \rfloor \sum_{k=1, k \neq l}^{3} \lambda_{k} \mathbf{u}_{k} \mathbf{u}_{k}^{T} \lfloor \mathbf{u}_{l} \rfloor - \lambda_{l} \lfloor \mathbf{u}_{l} \rfloor \sum_{k=1, k \neq l}^{3} \mathbf{u}_{k} \mathbf{u}_{k}^{T} \lfloor \mathbf{u}_{l} \rfloor. \quad (124)$$

Since  $\mathbf{u}_k$  (k=1,2,3) is the eigenvector (with eigenvalue  $\lambda_k$ ) of matrix  $\mathbf{A}$ , which is symmetric, we have the following two conditions from the singular value decomposition of  $\mathbf{A}$ :

$$\mathbf{A} = \sum_{k=1}^{3} \lambda_k \mathbf{u}_k \mathbf{u}_k^T, \quad \mathbf{I} = \sum_{k=1}^{3} \mathbf{u}_k \mathbf{u}_k^T, \quad (125)$$

which imply

$$\sum_{k=1,k\neq l}^{3} \lambda_k \mathbf{u}_k \mathbf{u}_k^T = \mathbf{A} - \lambda_l \mathbf{u}_l \mathbf{u}_l^T, \quad \sum_{k=1,k\neq l}^{3} \mathbf{u}_k \mathbf{u}_k^T = \mathbf{I} - \mathbf{u}_l \mathbf{u}_l^T.$$
(126)

Substituting the above results into  $L_l$  in (124):

$$\mathbf{L}_{l} = \lambda_{l} \lfloor \mathbf{u}_{l} \rfloor^{2} - \lfloor \mathbf{u}_{l} \rfloor \mathbf{A} \lfloor \mathbf{u}_{l} \rfloor$$

$$+ \lfloor \mathbf{u}_{l} \rfloor (\mathbf{A} - \lambda_{l} \mathbf{u}_{l} \mathbf{u}_{l}^{T}) \lfloor \mathbf{u}_{l} \rfloor - \lambda_{l} \lfloor \mathbf{u}_{l} \rfloor (\mathbf{I} - \mathbf{u}_{l} \mathbf{u}_{l}^{T}) \lfloor \mathbf{u}_{l} \rfloor$$

$$= \lambda_{l} |\mathbf{u}_{l}|^{2} - |\mathbf{u}_{l}| \mathbf{A} |\mathbf{u}_{l}| + |\mathbf{u}_{l}| \mathbf{A} |\mathbf{u}_{l}| - \lambda_{l} |\mathbf{u}_{l}|^{2} = \mathbf{0}. \quad (127)$$

As a result,

$$\delta \mathbf{T}^T \mathbf{H} \delta \mathbf{T} = \mathbf{w}^T \begin{bmatrix} 2\mathbf{L}_l & \mathbf{0}_{3\times 1} \\ \mathbf{0}_{1\times 3} & 0 \end{bmatrix} \mathbf{w} = 0.$$
 (128)

Finally, for the results in (40), if p or  $q \in \mathcal{I} \triangleq \{j | 1 \leq j \leq M_p, C_j = 0\}$ , we have  $\mathbf{g}_{kl}^p = \mathbf{0}_{1 \times 6}$  (or  $\mathbf{g}_{kl}^q = \mathbf{0}_{1 \times 6}$ ) and  $\mathbf{H}_{kl}^{p,q} = \mathbf{0}_{6 \times 6}, \forall k, l$ , from (19). As a result,  $\mathbf{J}^p = \mathbf{g}_{kl}^p = \mathbf{0}$  and  $\mathbf{H}^{p,q} = \mathbf{H}_{ll}^{p,q} + \sum_{k=1, k \neq l}^3 \frac{1}{2l - \lambda_k} (\mathbf{g}_{kl}^p)^T \mathbf{g}_{kl}^q = \mathbf{0}$ .  $\square$ 

#### F. Derivation of pose covariance

The quantity  $\delta \mathbf{C}_{f_{ij}}$  can be obtained by substituting (43) into the definition of  $\mathbf{C}_{f_{ij}}^{\mathrm{gt}}$  in (44) and retaining only the first order items:

$$\delta \mathbf{C}_{f_{ij}} = \begin{bmatrix} \delta \mathbf{P}_{f_{ij}} & \delta \mathbf{v}_{f_{ij}} \\ \delta \mathbf{v}_{f_{ij}}^T & 0 \end{bmatrix}, \quad \text{where}$$
 (129)

$$\delta \mathbf{P}_{f_{ij}} = \sum_{k=1}^{N_{ij}} (\mathbf{p}_{f_{ijk}} \delta \mathbf{p}_{f_{ijk}}^T + \delta \mathbf{p}_{f_{ijk}} \mathbf{p}_{f_{ijk}}^T), \tag{130}$$

$$\delta \mathbf{v}_{f_{ij}} = \sum_{k=1}^{N_{ij}} \delta \mathbf{p}_{f_{ijk}}.$$
(131)

To derive  $\frac{\partial \mathbf{J}^T(\mathbf{T}^\star, \mathbf{C}_f)}{\partial \mathbf{C}_f} \delta \mathbf{C}_f$  with involving any tensor, we parameterize the matrix  $\mathbf{C}_{f_{ij}}$  by a column vector  $\mathbf{c}_{f_{ij}}$ , which consists of the independent elements in  $\mathbf{C}_{f_{ij}}$ :

$$\mathbf{c}_{f_{ij}} = \operatorname{vec}(\mathbf{C}_{f_{ij}}) \triangleq \begin{bmatrix} \mathbf{e}_{1}^{T} \mathbf{C}_{f_{ij}} \mathbf{e}_{1} & \mathbf{e}_{1}^{T} \mathbf{C}_{f_{ij}} \mathbf{e}_{2} & \mathbf{e}_{1}^{T} \mathbf{C}_{f_{ij}} \mathbf{e}_{3} \\ \mathbf{e}_{2}^{T} \mathbf{C}_{f_{ij}} \mathbf{e}_{2} & \mathbf{e}_{2}^{T} \mathbf{C}_{f_{ij}} \mathbf{e}_{3} & \mathbf{e}_{3}^{T} \mathbf{C}_{f_{ij}} \mathbf{e}_{3} \\ \mathbf{e}_{1}^{T} \mathbf{C}_{f_{ij}} \mathbf{e}_{4} & \mathbf{e}_{2}^{T} \mathbf{C}_{f_{ij}} \mathbf{e}_{4} & \mathbf{e}_{3}^{T} \mathbf{C}_{f_{ij}} \mathbf{e}_{4} \end{bmatrix}^{T} \in \mathbb{R}^{9}$$
 (132)

where  $\text{vec}(\cdot): \mathbb{S}^{4\times 4} \mapsto \mathbb{R}^9$  maps a symmetric matrix to its column vector representation,  $\mathbf{e}_l \in \mathbb{R}^4$   $(l \in \{1,2,3,4\})$  is a vector with all zero elements except for the l-th element being one. Note that the constant N in the 4-th row, 4-th column of  $\mathbf{C}_{f_{ij}}$  is not contained in  $\mathbf{c}_{f_{ij}}$  since it is a constant number independent of the noise. Correspondingly, noises in  $\mathbf{C}_{f_{ij}}$  becomes the noise of  $\mathbf{c}_{f_{ij}}$  as below:

$$\delta \mathbf{c}_{f_{ij}} = \begin{bmatrix} \mathbf{e}_{1}^{T} \delta \mathbf{C}_{f_{ij}} \mathbf{e}_{1} & \mathbf{e}_{1}^{T} \delta \mathbf{C}_{f_{ij}} \mathbf{e}_{2} & \mathbf{e}_{1}^{T} \delta \mathbf{C}_{f_{ij}} \mathbf{e}_{3} \\ \mathbf{e}_{2}^{T} \delta \mathbf{C}_{f_{ij}} \mathbf{e}_{2} & \mathbf{e}_{2}^{T} \delta \mathbf{C}_{f_{ij}} \mathbf{e}_{3} & \mathbf{e}_{3}^{T} \delta \mathbf{C}_{f_{ij}} \mathbf{e}_{3} \end{bmatrix}$$

$$\mathbf{e}_{1}^{T} \delta \mathbf{C}_{f_{ij}} \mathbf{e}_{4} & \mathbf{e}_{2}^{T} \delta \mathbf{C}_{f_{ij}} \mathbf{e}_{4} & \mathbf{e}_{3}^{T} \delta \mathbf{C}_{f_{ij}} \mathbf{e}_{4} \end{bmatrix}^{T}$$

$$(133)$$

$$\mathbf{e}_{1}^{T} \delta \mathbf{C}_{f_{ij}} \mathbf{e}_{4} & \mathbf{e}_{2}^{T} \delta \mathbf{C}_{f_{ij}} \mathbf{e}_{4} & \mathbf{e}_{3}^{T} \delta \mathbf{C}_{f_{ij}} \mathbf{e}_{4} \end{bmatrix}^{T}$$

$$\mathbf{e}_{1}^{T} \delta \mathbf{C}_{f_{ij}} \mathbf{e}_{4} & \mathbf{e}_{2}^{T} \delta \mathbf{C}_{f_{ij}} \mathbf{e}_{4} \end{bmatrix}^{T}$$

$$\mathbf{e}_{1}^{T} \delta \mathbf{C}_{f_{ij}} \mathbf{e}_{5} \mathbf{e}_{11} \mathbf{e}$$

where  $\mathbf{S}_{P} = [\mathbf{I}_{3\times3}, 0_{3\times1}], \ \mathbf{E}_{kl} = \mathbf{e}_{k}\mathbf{e}_{l}^{T} + \mathbf{e}_{l}\mathbf{e}_{k}^{T} \in \mathbb{S}^{4\times4}, \ k, l \in \{1, 2, 3, 4\},$  and

$$\mathbf{B}_{f_{ijk}} = \begin{bmatrix} 2\mathbf{p}_{f_{ijk}}^T \mathbf{S}_{P} \mathbf{E}_{11} \mathbf{S}_{P}^T \\ \mathbf{p}_{f_{ijk}}^T \mathbf{S}_{P} \mathbf{E}_{12} \mathbf{S}_{P}^T \\ \mathbf{p}_{f_{ijk}}^T \mathbf{S}_{P} \mathbf{E}_{13} \mathbf{S}_{P}^T \\ 2\mathbf{p}_{f_{ijk}}^T \mathbf{S}_{P} \mathbf{E}_{22} \mathbf{S}_{P}^T \\ \mathbf{p}_{f_{ijk}}^T \mathbf{S}_{P} \mathbf{E}_{23} \mathbf{S}_{P}^T \\ 2\mathbf{p}_{f_{ijk}}^T \mathbf{S}_{P} \mathbf{E}_{33} \mathbf{S}_{P}^T \\ \mathbf{I}_{3\times 3} \end{bmatrix} \in \mathbb{R}^{9\times 3}.$$
 (135)

With the column representation of each  $\mathbf{C}_{f_{ijk}}$  contained in  $\mathbf{C}_f$ ,  $\frac{\partial \mathbf{J}^T(\mathbf{T}^\star, \mathbf{C}_f)}{\partial \mathbf{C}_f} \delta \mathbf{C}_f$  can now be computed as

$$\frac{\partial \mathbf{J}^{T}\left(\mathbf{T}^{\star}, \mathbf{C}_{f}\right)}{\partial \mathbf{C}_{f}} \delta \mathbf{C}_{f} = \sum_{i=1}^{M_{f}} \sum_{i=1}^{M_{p}} \frac{\partial \mathbf{J}^{T}\left(\mathbf{T}^{\star}, \mathbf{C}_{f_{ij}}\right)}{\partial \mathbf{c}_{f_{ij}}} \delta \mathbf{c}_{f_{ij}}.$$
 (136)

To derive the quantity  $\frac{\partial \mathbf{J}^T(\mathbf{T}^{\star}, \mathbf{C}_{f_{ij}})}{\partial \mathbf{c}_{f_{ij}}}$ , we give two lemmas which are useful for subsequent deduction.

**Lemma 3.** For  $\mathbf{w} \in \mathbb{R}^4$ ,  $\mathbf{C} \in \mathbb{S}^{4 \times 4}$  and its vector form  $\mathbf{c} = \text{vec}(\mathbf{C})$ , we have

$$\frac{\partial \mathbf{C} \mathbf{w}}{\partial \mathbf{c}} = \mathbf{g}_1(\mathbf{w}) \in \mathbb{R}^{4 \times 9},$$

where

$$\mathbf{g}_1(\mathbf{w}) = \begin{bmatrix} \mathbf{E}_{11}\mathbf{w} & \mathbf{E}_{12}\mathbf{w} & \mathbf{E}_{13}\mathbf{w} & \mathbf{E}_{22}\mathbf{w} & \mathbf{E}_{23}\mathbf{w} \\ & \mathbf{E}_{33}\mathbf{w} & \mathbf{E}_{14}\mathbf{w} & \mathbf{E}_{24}\mathbf{w} & \mathbf{E}_{34}\mathbf{w} \end{bmatrix},$$

where  $\mathbf{e}_l \in \mathbb{R}^4$   $(l \in \{1, 2, 3, 4\})$  is a vector with all zero elements except for the l-th element being one,  $\mathbf{E}_{kl} \in \mathbb{S}^{4 \times 4}$ ,  $k, l \in \{1, 2, 3, 4\}$ .

$$\mathbf{E}_{kl} = \begin{cases} \mathbf{e}_k \mathbf{e}_l^T + \mathbf{e}_l \mathbf{e}_k^T \ (k \neq l) \\ \mathbf{e}_l \mathbf{e}_l^T \ (k = l) \end{cases}$$
(137)

*Proof.* For the k-th row, l-th column element of C, denoted by  $C_{k,l}$ , we have

$$\frac{\partial \mathbf{C} \mathbf{w}}{\partial \mathbf{C}_{k,l}} = \mathbf{E}_{kl} \mathbf{w} \in \mathbb{R}^4.$$

Hence,

$$\begin{split} \frac{\partial \mathbf{C} \mathbf{w}}{\partial \mathbf{c}} &= \begin{bmatrix} \frac{\partial \mathbf{C} \mathbf{w}}{\partial \mathbf{C}_{1,1}} & \frac{\partial \mathbf{C} \mathbf{w}}{\partial \mathbf{C}_{1,2}} & \frac{\partial \mathbf{C} \mathbf{w}}{\partial \mathbf{C}_{1,3}} & \frac{\partial \mathbf{C} \mathbf{w}}{\partial \mathbf{C}_{2,2}} & \frac{\partial \mathbf{C} \mathbf{w}}{\partial \mathbf{C}_{2,3}} \\ & \frac{\partial \mathbf{C} \mathbf{w}}{\partial \mathbf{C}_{3,3}} & \frac{\partial \mathbf{C} \mathbf{w}}{\partial \mathbf{C}_{1,4}} & \frac{\partial \mathbf{C} \mathbf{w}}{\partial \mathbf{C}_{2,4}} & \frac{\partial \mathbf{C} \mathbf{w}}{\partial \mathbf{C}_{3,4}} \end{bmatrix} \\ &= \begin{bmatrix} \mathbf{E}_{11} \mathbf{w} & \mathbf{E}_{12} \mathbf{w} & \mathbf{E}_{13} \mathbf{w} & \mathbf{E}_{22} \mathbf{w} & \mathbf{E}_{23} \mathbf{w} \\ & \mathbf{E}_{33} \mathbf{w} & \mathbf{E}_{14} \mathbf{w} & \mathbf{E}_{24} \mathbf{w} & \mathbf{E}_{34} \mathbf{w} \end{bmatrix}. \end{split}$$

**Lemma 4.** For  $\mathbf{u}_l \in \mathbb{R}^3$  and

$$\mathbf{w} = \begin{bmatrix} \mathbf{w}_{1:3} \\ w_4 \end{bmatrix} \in \mathbb{R}^4, \quad \mathbf{U}_l = \begin{bmatrix} -\lfloor \mathbf{u}_l \rfloor & \mathbf{0}_{3 \times 1} \\ \mathbf{0}_{3 \times 3} & \mathbf{u}_l \end{bmatrix} \in \mathbb{R}^{6 \times 4}$$

where  $\mathbf{w}_{1:3}$  represents the first three elements in  $\mathbf{w}$ , we have

$$\frac{\partial \mathbf{U}_l \mathbf{w}}{\partial \mathbf{u}_l} = \mathbf{g}_2(\mathbf{w}) = \begin{bmatrix} \lfloor \mathbf{w}_{1:3} \rfloor \\ w_4 \mathbf{I}_{3 \times 3} \end{bmatrix} \in \mathbb{R}^{6 \times 3}.$$

Proof.

$$\mathbf{U}_{l}\mathbf{w} = \begin{bmatrix} -\lfloor \mathbf{u}_{l} \rfloor & \mathbf{0} \\ \mathbf{0} & \mathbf{u}_{l} \end{bmatrix} \begin{bmatrix} \mathbf{w}_{1:3} \\ w_{4} \end{bmatrix} = \begin{bmatrix} \lfloor \mathbf{w}_{1:3} \rfloor \mathbf{u}_{l} \\ w_{4} \mathbf{u}_{l} \end{bmatrix} = \begin{bmatrix} \lfloor \mathbf{w}_{1:3} \rfloor \\ w_{4} \mathbf{I}_{3 \times 3} \end{bmatrix} \mathbf{u}_{l}$$

Thus,

$$\frac{\partial \mathbf{U}_l \mathbf{w}}{\partial \mathbf{u}_l} = \begin{bmatrix} \begin{bmatrix} \mathbf{w}_{1:3} \end{bmatrix} \\ w_4 \mathbf{I}_{3 \times 3} \end{bmatrix} = \mathbf{g}_2(\mathbf{w})$$

With these two lemmas, next we will continue to derive  $\frac{\partial \mathbf{J}^T(\mathbf{T}^\star, \mathbf{C}_{f_{ij}})}{\partial \mathbf{c}_{f_{ij}}}$ . Theorem 4 gives the Jacobian for one cost item, to distinguish the different cost item, we add a subscript  $\nu$  to (30) to denotes the  $\nu$ -th item and replace  $\mathbf{C}_j$  with the actual

point cluster notation  $\mathbf{C}_{f_{\nu j}}$  corresponding to the  $\nu$ -th item, leading to:

$$\mathbf{J}_{\nu} = \begin{bmatrix} \cdots & \mathbf{J}_{\nu}^{p} & \cdots \end{bmatrix} \in \mathbb{R}^{1 \times 6M_{p}}$$

$$\mathbf{J}_{\nu}^{p} = \frac{2}{N} \mathbf{u}_{\nu l}^{T} \mathbf{S}_{\mathbf{P}} \left( \mathbf{T}_{p} - \frac{1}{N} \mathbf{C}_{\nu} \mathbf{F} \right) \mathbf{C}_{f_{\nu p}} \mathbf{T}_{p}^{T} \mathbf{U}_{\nu l}^{T} \in \mathbb{R}^{1 \times 6}.$$
(138)

The total Jacobian is hence

$$\mathbf{J} = \sum_{\nu=1}^{M_f} \mathbf{J}_{\nu} = \begin{bmatrix} \cdots & \mathbf{J}^p & \cdots \end{bmatrix} \in \mathbb{R}^{1 \times 6M_p},$$

$$\mathbf{J}^p = \sum_{\nu=1}^{M_f} \mathbf{J}_{\nu}^p \in \mathbb{R}^{1 \times 6},$$

$$= \sum_{\nu=1}^{M_f} \left( \frac{2}{N} \mathbf{u}_{\nu l}^T \mathbf{S}_{\mathbf{P}} \left( \mathbf{T}_{p} - \frac{1}{N} \mathbf{C}_{\nu} \mathbf{F} \right) \mathbf{C}_{f_{\nu p}} \mathbf{T}_{p}^T \mathbf{U}_{\nu l}^T \right).$$
 (140)

Next, we calculate the partial derivative  $\frac{\partial (\mathbf{J}^{\mathbf{p}})^T}{\partial \mathbf{c}_{f_{ij}}}$ . Note that in the summation of (140), only the *i*-th summation term (i.e.,  $\nu = i$ ) is related to  $\mathbf{c}_{f_{ij}}$ , hence,

$$\frac{\partial \left(\mathbf{J}^{\mathbf{p}}\right)^{T}}{\partial \mathbf{c}_{f_{ij}}} = \frac{\partial}{\partial \mathbf{c}_{f_{ij}}} \left( \frac{2}{N_{i}} \mathbf{U}_{il} \mathbf{T}_{\mathbf{p}} \mathbf{C}_{f_{ip}} (\mathbf{T}_{\mathbf{p}}^{T} - \frac{1}{N_{i}} \mathbf{F} \mathbf{C}_{i}) \mathbf{S}_{\mathbf{p}}^{T} \mathbf{u}_{il} \right). \tag{141}$$

Since  $\mathbf{C}_i = \sum_{\nu=1}^{M_p} \mathbf{T}_{\nu} \mathbf{C}_{f_{i\nu}} \mathbf{T}_{\nu}^T$ ,  $\mathbf{u}_{il}$  is the eigenvector associated to the l-th largest eigenvalue of matrix  $\mathbf{A}(\mathbf{C}_i)$ , and  $\mathbf{U}_{il} = \begin{bmatrix} -\lfloor \mathbf{u}_{il} \rfloor & \mathbf{0}_{3\times 1} \\ \mathbf{0}_{3\times 3} & \mathbf{u}_{il} \end{bmatrix}$ , the derivative with respect to  $\mathbf{c}_{f_{ij}}$  on the right hand side of (141) consists of four terms from  $\mathbf{U}_{il}$ ,  $\mathbf{C}_{f_{ip}}$  (only when  $\mathbf{p} = j$ ),  $\mathbf{C}_i$ , and  $\mathbf{u}_{il}$ , respectively. Combining with Lemma 3 and Lemma 4, we have

$$\mathbf{L}_{ij}^{p} \triangleq \frac{\partial \left(\mathbf{J}^{p}\right)^{T}}{\partial \mathbf{c}_{f_{ij}}} \in \mathbb{R}^{6 \times 9}$$

$$= \frac{2}{N_{i}} \left( \mathbf{g}_{2} (\mathbf{T}_{p} \mathbf{C}_{f_{ip}} (\mathbf{T}_{p}^{T} - \frac{1}{N_{i}} \mathbf{F} \mathbf{C}_{i}) \mathbf{S}_{\mathbf{P}}^{T} \mathbf{u}_{il} \right)$$

$$+ \mathbf{U}_{il} \mathbf{T}_{p} \mathbf{C}_{f_{ip}} (\mathbf{T}_{p}^{T} - \frac{1}{N} \mathbf{F} \mathbf{C}_{i}) \mathbf{S}_{\mathbf{P}}^{T} \right) \frac{\partial \mathbf{u}_{il}}{\partial \mathbf{c}_{f_{ij}}}$$

$$- \frac{2}{N_{i}^{2}} \mathbf{U}_{il} \mathbf{T}_{p} \mathbf{C}_{f_{ip}} \mathbf{F} \mathbf{T}_{j} \mathbf{g}_{1} (\mathbf{T}_{j}^{T} \mathbf{S}_{\mathbf{P}}^{T} \mathbf{u}_{il})$$

$$+ \frac{2}{N_{i}} \mathbb{1}_{p=j} \left( \mathbf{U}_{il} \mathbf{T}_{p} \mathbf{g}_{1} \left( (\mathbf{T}_{p}^{T} - \frac{1}{N_{i}} \mathbf{F} \mathbf{C}_{i}) \mathbf{S}_{\mathbf{P}}^{T} \mathbf{u}_{il} \right) \right)$$

$$(143)$$

Only the term  $\frac{\partial \mathbf{u}_{il}}{\partial \mathbf{c}_{f_{ij}}}$  is unknown in this formula. To compute it, we apply the second conclusion in Lemma 1 to all components of  $\mathbf{c}_{f_{ij}}$  and use the notation trick similar to (81):

$$\frac{\partial \mathbf{u}_{il}}{\partial \mathbf{c}_{f_{ij}}} = \sum_{k=1, k \neq l}^{3} \frac{1}{\lambda_{il} - \lambda_{ik}} \mathbf{u}_{ik} \mathbf{u}_{ik}^{T} \frac{\partial \mathbf{A}(\mathbf{C}_{i}) \mathbf{u}_{il}}{\partial \mathbf{c}_{f_{ij}}}$$
(144)

From Lemma 2,

П

$$\mathbf{u}_{ik}^{T}\mathbf{A}(\mathbf{C}_{i})\mathbf{u}_{il} = \frac{1}{N_{i}}\mathbf{u}_{ik}^{T}\mathbf{S}_{\mathbf{P}}$$

$$\left(\sum_{\mu=1}^{M_{p}}\mathbf{T}_{\mu}\mathbf{C}_{f_{i\mu}}\mathbf{T}_{\mu}^{T} - \frac{1}{N_{i}}\sum_{\mu=1}^{M_{p}}\sum_{\nu=1}^{M_{p}}\mathbf{T}_{\mu}\mathbf{C}_{f_{i\mu}}\mathbf{F}\mathbf{C}_{f_{i\nu}}\mathbf{T}_{\nu}^{T}\right)\mathbf{S}_{\mathbf{P}}^{T}\mathbf{u}_{il}$$

Denote

$$\mathbf{G}_{kl}^{ij} \triangleq \frac{\partial \mathbf{u}_{ik}^{T} \mathbf{A}(\mathbf{C}_{f_{i}}) \mathbf{u}_{il}}{\partial \mathbf{c}_{f_{ij}}} = \frac{1}{N_{i}} \mathbf{u}_{ik}^{T} \mathbf{S}_{\mathbf{P}} \mathbf{T}_{j} \mathbf{g}_{1} (\mathbf{T}_{j}^{T} \mathbf{S}_{\mathbf{P}}^{T} \mathbf{u}_{il})$$

$$- \frac{1}{N_{i}^{2}} \mathbf{u}_{ik}^{T} \mathbf{S}_{\mathbf{P}} \sum_{\mu=1}^{M_{p}} \mathbf{T}_{\mu} \mathbf{C}_{f_{i\mu}} \mathbf{F} \mathbf{g}_{1} (\mathbf{T}_{j}^{T} \mathbf{S}_{\mathbf{P}}^{T} \mathbf{u}_{il})$$

$$- \frac{1}{N_{i}^{2}} \mathbf{u}_{ik}^{T} \mathbf{S}_{\mathbf{P}} \mathbf{T}_{j} \mathbf{g}_{1} \left( \sum_{\nu=1}^{M_{p}} \mathbf{F} \mathbf{C}_{f_{i\nu}} \mathbf{T}_{\nu}^{T} \mathbf{S}_{\mathbf{P}}^{T} \mathbf{u}_{il} \right) \in \mathbb{R}^{1 \times 9}$$

$$= \frac{1}{N_{i}} \mathbf{u}_{ik}^{T} \mathbf{S}_{\mathbf{P}} \left( \mathbf{T}_{j} \mathbf{g}_{1} (\mathbf{T}_{j}^{T} \mathbf{S}_{\mathbf{P}}^{T} \mathbf{u}_{il}) - \frac{1}{N_{i}} \mathbf{C}_{i} \mathbf{F} \mathbf{g}_{1} (\mathbf{T}_{j}^{T} \mathbf{S}_{\mathbf{P}}^{T} \mathbf{u}_{il}) - \frac{1}{N_{i}} \mathbf{C}_{i} \mathbf{F} \mathbf{g}_{1} (\mathbf{T}_{j}^{T} \mathbf{S}_{\mathbf{P}}^{T} \mathbf{u}_{il}) \right)$$

$$- \frac{1}{N_{i}} \mathbf{T}_{j} \mathbf{g}_{1} (\mathbf{F} \mathbf{C}_{i} \mathbf{S}_{\mathbf{P}}^{T} \mathbf{u}_{il}) \right)$$

$$(145)$$

Substitute it into  $\mathbf{L}_{ij}^{p}$ :

$$\mathbf{L}_{ij}^{p} = \frac{2}{N_{i}} \left( \mathbf{g}_{2} (\mathbf{T}_{p} \mathbf{C}_{f_{ip}} (\mathbf{T}_{p}^{T} - \frac{1}{N_{i}} \mathbf{F} \mathbf{C}_{i}) \mathbf{S}_{\mathbf{P}}^{T} \mathbf{u}_{il} \right) +$$

$$\mathbf{U}_{il} \mathbf{T}_{p} \mathbf{C}_{f_{ip}} (\mathbf{T}_{p}^{T} - \frac{1}{N} \mathbf{F} \mathbf{C}_{i}) \mathbf{S}_{\mathbf{P}}^{T} \right) \left( \sum_{k=1, k \neq l}^{3} \frac{\mathbf{u}_{ik} \mathbf{G}_{kl}^{ij}}{\lambda_{il} - \lambda_{ik}} \right)$$

$$- \frac{2}{N_{i}^{2}} \mathbf{U}_{il} \mathbf{T}_{p} \mathbf{C}_{f_{ip}} \mathbf{F} \mathbf{T}_{j} \mathbf{g}_{1} (\mathbf{T}_{j}^{T} \mathbf{S}_{\mathbf{P}}^{T} \mathbf{u}_{il})$$

$$+ \frac{2}{N_{i}} \mathbb{1}_{p=j} \left( \mathbf{U}_{il} \mathbf{T}_{p} \mathbf{g}_{1} \left( (\mathbf{T}_{p}^{T} - \frac{1}{N_{i}} \mathbf{F} \mathbf{C}_{i}) \mathbf{S}_{\mathbf{P}}^{T} \mathbf{u}_{il} \right) \right), \quad (146)$$

$$\mathbf{L}_{ij} = \frac{\partial \mathbf{J}^{T} \left( \mathbf{T}^{\star}, \mathbf{C}_{f_{ij}} \right)}{\partial \mathbf{c}_{f_{ij}}} = \begin{bmatrix} \vdots \\ \mathbf{L}_{ij}^{p} \\ \vdots \end{bmatrix} \in \mathbb{R}^{6M_{p} \times 9}, \quad (147)$$

and

$$\delta \mathbf{T}^{\star} = -\mathbf{H}^{-1} \left( \sum_{i=1}^{M_f} \sum_{j=1}^{M_p} \mathbf{L}_{ij} \delta \mathbf{c}_{f_{ij}} \right) \in \mathbb{R}^{6M_p}, \quad (148)$$

$$\mathbf{\Sigma}_{\delta \mathbf{T}^{\star}} = \mathbf{H}^{-1} \left( \sum_{i=1}^{M_f} \sum_{j=1}^{M_p} \mathbf{L}_{ij} \mathbf{\Sigma}_{\mathbf{c}_{f_{ij}}} \mathbf{L}_{ij}^T \right) \mathbf{H}^{-1}, \quad (149)$$

where

$$\Sigma_{\mathbf{c}_{f_{ij}}} = \sum_{k=1}^{N_{ij}} \mathbf{B}_{f_{ijk}} \Sigma_{\mathbf{p}_{f_{ijk}}} \mathbf{B}_{f_{ijk}}^T,$$
 (150)

which can be computed beforehand without enumerating each raw point in the run time.
